### 2.2.5.2 Connection procedure

- (1) Connects the transceiver to the computer using the interface cable (KPG-46U/46X).

#### Note:

You must install the KPG-46U/46X driver in the computer to use the USB programming interface cable (KPG-46U/46X).

- (2) When the POWER switch on, user mode can be entered immediately. When PC sends command the transceiver enter PC mode, and "PROGRAM" is displayed on the LCD. When data transmitting from the transceiver, the red LED lights.  
When data receiving to the transceiver, the green LED lights.

#### Note:

The data stored in the computer must match the "Model Name" when it is written into the flash memory.

### 2.2.5.3 KPG-46U/46X description (USB programming interface cable: Option)

The KPG-46U/46X is a cable which connects to a USB port on a computer.

When using the KPG-46U/46X, install the supplied CD (with driver software) in the computer. The KPG-46U driver runs under Windows XP, Vista, 7, 8 or 8.1.

The KPG-46X driver runs under Windows Vista, 7, 8 or 8.1.

The latest version of the USB driver is available for download from the following URL:

(This URL may change without notice.)

### 2.2.5.4 Programming software KPG-D1/D1N (Ver. 1.60 or later) description

The FPU is the programming software for the transceiver supplied on a CD. This software runs under Windows Vista, 7, 8 or 8.1 on a PC.

The data can be input to or read from the transceiver and edited on the screen.

### 2.2.6 Firmware Programming Mode

#### 2.2.6.1 Preface

Flash memory is mounted on the transceiver. This allows the transceiver to be upgrade when new features are released in the future. (For details on how to obtain the firmware, contact Customer Service.)

#### 2.2.6.2 Connection procedure

Connect the transceiver to the personal computer using the programming interface (KPG-46U/46X). (Connection is same as in the PC mode.)

#### 2.2.6.3 Programming

- (1) Start up the firmware programming software (KENWOOD Firmware Loader). The KFL.exe exists in the KPG-D1/D1N installed folder.
- (2) Set the baud rate to "auto" or 1152000, 576000, 115200, and 57600.
- (3) Set the firmware to be upgrade by file name item.
- (4) Enter the Firmware programming mode by using section "2.2.2 How to Enter Each Mode". Then, the yellow LED on the transceiver light and "FIRMWARE PROG" is displayed.
- (5) Check the connection between the transceiver and the personal computer, and make sure that the transceiver is in the Program mode.
- (6) Press "Write" button in the window. When the transceiver starts to receive data, the "LOADING" display lights.

- (7) If writing ends successfully, the checksum is calculated and a result is displayed.

- (8) If you want to continue programming other transceivers, repeat step (4) to (7).

#### Note:

If write is performed by KFL, Firmware programming mode will start automatically even if Firmware programming is set to disable in the programming software.

### 2.2.6.4 Function

If you press the [ O ] key while "FIRMWARE PROG" is displayed, the checksum is calculated, and a result is displayed. If you press the [ O ] key again while checksum is displayed, "FIRMWARE PROG" is redisplayed.

### 2.2.7 Clone Mode

Programming data can be transferred from one transceiver to another by connecting them via their modular microphone jacks. The operation is as follows.

#### ■The following data cannot be cloned.

- Tuning data
- Embedded message with password
- ESN (Electronic Serial Number) data

#### ■Key guide on the Clone/ Front Panel Programming Password input screen.

- Confirm ([ □ ] key): The password confirmation
- Delete ([ ↵ ] key): Delete the latest digit from the current password number (Press and hold to delete all password numbers)
- Select([ □ ] key): Determine the latest digit of the password number.

- (1) In the source transceiver, enter the clone mode by using section "2.2.2 How to Enter Each Mode". When the Clone/ Front Panel Programming Password is set to the transceiver, "Input Password" is displayed on the LCD.  
If the password is not set, the transceiver displays "CLONE MODE".

- (2) When you enter the correct password, "CLONE MODE" is displayed, the transceiver can be used as the cloning source. The following describes how to enter the password.

(3)

#### - How to enter the password using the MIC keypad;

If one of the keys 0 to 9 is pressed while the "Input Password" is displayed, the password number is displayed on the LCD.

Each press of the key shifts the display in order to the left.

When you enter the password and press [ □ ] or [\*] key, "CLONE MODE" displayed if the entered password is correct. If password is incorrect, "Input Password" is redisplayed.

#### - How to enter password using the [ ▲ ] and [ ▼ ] keys;

If the [ ▲ ] / [ ▼ ] key is pressed while "Input Password" is displayed, the Clone/ Front Panel Programming Password input screen is displayed.

If the [ ▲ ] or [ ▼ ] key is pressed while the clone/ Front Panel Programming Password input screen is displayed, the number (0 to 9) blinks on the LCD. When you press the [ □ ] key, currently selected number is determined. If you press the [ □ ] key after entering password in this procedure, "CLONE MODE" is displayed if entered pass-

word is correct. If the password is incorrect, "Input Password" is redisplayed.

- (4) Power ON the target transceiver.
- (5) Connecting the cloning cable (part No.E30-3382-05) to the modular microphone jacks on the source and target.
- (6) Press [] key on the source while the source displays "CLONE MODE". The data of the source is sent to the target. While the target is receiving the data, "PROGRAM" is displayed. When cloning of the data is completed, the source displays "END", and the target automatically operates in the User mode. The target can then be operated by the same program as the source.
- (7) The other target can be continuously cloned. When the [] key on the source is pressed while the source displays "END", the source displays "CLONE MODE". Carry out the operation in step (4) to (6).

**Note:**

- Cannot be cloned if the password (overwrite password) is programmed to the target.
- "Model name" must be same to clone the transceiver.

## 2.4 CIRCUIT DESCRIPTION

### 2.4.1 Overview

The NX-5900 is a 700/800MHz Analog FM & Digital Mobile transceiver designed to operate in the frequency range of 763 to 775.99375MHz, 793 to 805.99375MHz (700M) and 806 to 825MHz, 851 to 870MHz (800M). The unit consists of a receiver, a transmitter, a phase-locked loop (PLL) frequency synthesizer, a digital control unit, and a power supply circuit.

### 2.4.2 Frequency Configuration

The receiver is a double-conversion super-heterodyne using first intermediate frequency (IF) of 58.05MHz and second IF of 2.25MHz. Incoming signals from the antenna are mixed with the local signal from the PLL circuit to produce the first IF of 58.05MHz. This is then mixed with the 55.8MHz second local oscillator output to produce the 2.25MHz second IF. The transmit signal frequency is generated by the PLL VCO, and modulated by the signal from the DSP. It is then amplified and fed to the antenna.

### 2.4.3 Receiver System

#### 2.4.3.1 RF circuit

The receive signal from antenna SW (D305, D306, D308, D310, and D311) is amplified by a RF amplifier (700MHz band: Q501, 800MHz band: Q502) and passes through the band-pass filter (700MHz band: L521, L510, 800MHz band: L522, L511) to remove unwanted signals. These are controlled with the RF filter switch (IC501 and IC502).The signal is then fed to the 1st mixer (IC500).

#### 2.4.3.2 IF circuit

The first IF signal is passed through a four-pole monolithic crystal filter (XF600) to reject adjacent channel signal. The filtered first IF signal is amplified by the first IF amplifier (Q604 and Q603) and then applied to the IF system IC (IC600). The IF system IC provides a second mixer, second PLL, AGC and A/D converter.

The second mixer mixes the first IF signal with the 55.8MHz of second local oscillator output and produces the second IF signal of 2.25MHz.

The second IF signal is then be fed into an ADC, generates the I and Q data. This data is in the form of SSI (Serial Synchronous Interface), and sent to the DSP (IC706).

#### 2.4.3.3 Audio amplifier circuit

Audio processing (high-pass filter, low-pass filter, de-emphasized and so on) at Analog FM mode and decoding at Digital mode are processed by DSP. SSI signal from DSP is converted to audio signal at IC902. The signal goes to internal speaker and connector for external speaker (J900) through the amplifier (IC903), electronic volume control (IC719) and audio amplifier (IC911).

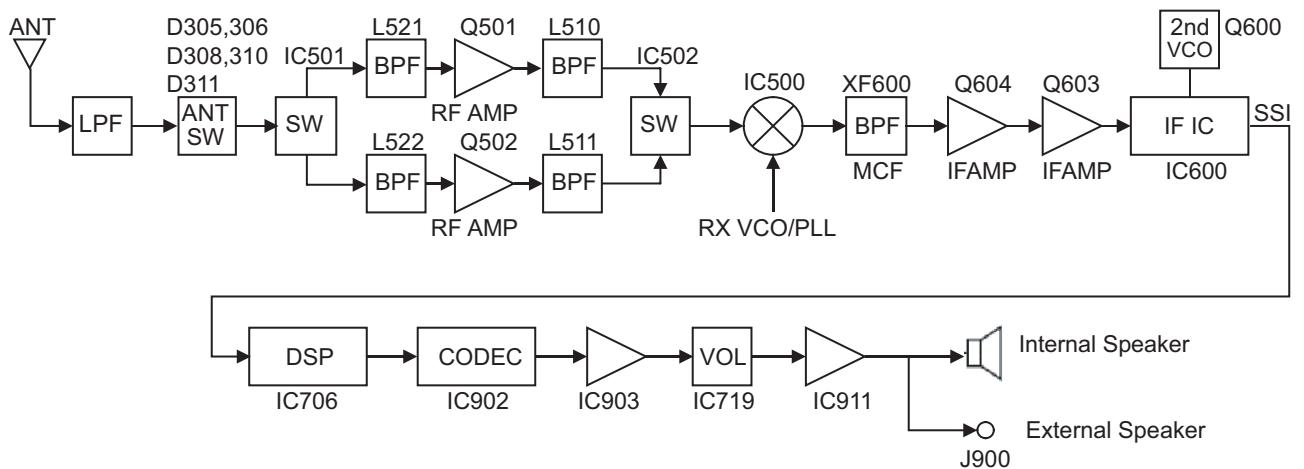

Fig.2 RF and IF circuit

## 2.4.4 Transmitter System

### 2.4.4.1 Audio Band Circuit

The signal from microphone is amplified and converted to digital signal by IC902. IC902 includes AGC function. Digital signal is transferred to IC706 thru SSI.

### 2.4.4.2 Base Band Circuit

The audio signal transferred from IC902 is processed at IC706. Voice signals of 300Hz or lower and frequencies of 3kHz or higher are cut off and an audio range 300Hz to 3kHz is extracted. The audio signal is then pre-emphasized in FM mode and synthesized with the signals, such as QT and DQT, as required, and is transferred to PLL Frequency Synthesizer block. The DTMF and MSK base band signals are also generated by IC706.

In Digital mode, the audio signal is converted to the 4-Level FSK base band signal and is transferred to PLL Frequency Synthesizer block.

The output level according to the transmit carrier is fine-adjusted according to each modulation method.

### 2.4.4.3 Drive and Final amplifier

The signal from the TX VCO is amplified by the pre-drive amplifier (IC300, Q300 and Q301). The output of the pre-drive amplifier is amplified by the drive amplifier (Q302) and the final amplifier (Q303) to 30W at 700MHz or 35W at 800MHz band (2W when the power is low). IC300 is MMIC. Q300, Q301, Q302, and Q303 are MOS FET.

The output of the final amplifier is then passed through the coupler, antenna switch (D305, D306, D308, D310, and D311), harmonic filter (LPF) and applied to the antenna terminal.

### 2.4.4.4 APC circuit

The automatic transmission power control (APC) circuit controls the transmitter output in adjusted value by monitoring it with a coupler. RF detection and comparison functions are included in the power-control IC (IC302).

The output of the power control IC is given as a drive source of each gate of the pre-drive amplifier (Q300 and Q301) and the drive amplifier (Q302) and completes APC feedback loop.

When a normal antenna load is connected, reflected Forward RF Power is detected by the coupler and direct in the power-control IC (IC302). Forward RF Power is converted into DC voltage in IC302 and is compared with APC1.

The output voltage goes through DC amplifier (IC303) to the pre-drive amplifier (Q300 and Q301) and the drive amplifier (Q302).

The voltage controls the gate bias1 voltage of Q300, Q301 and Q302, and keeps transmission output power stable.

SPC controls the gate bias2 voltage of Q303.

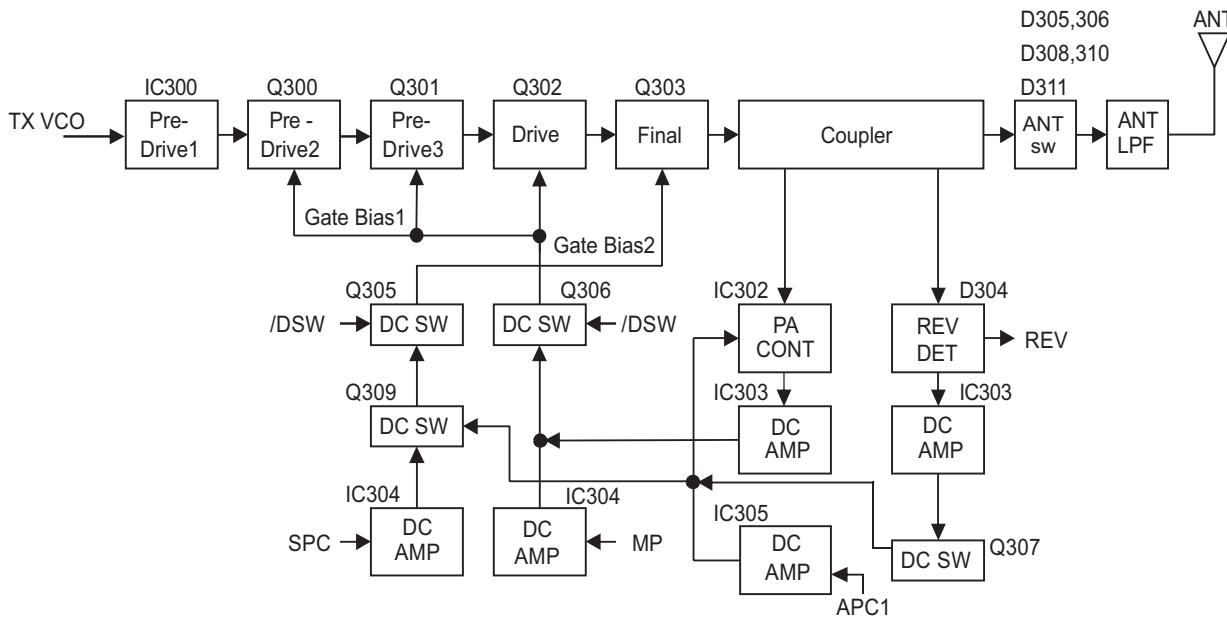

Fig.3 Drive and Final amplifier and APC circuit

## 2.4.5 PLL Frequency Synthesizer

### 2.4.5.1 TCXO (X700)

TCXO (X700) generates a reference frequency of 19.2MHz for the PLL frequency synthesizer. This reference signal is buffered by Q700 and IC703. And it is distributed to PLL (IC100), IF IC (IC600), and IC706.

The frequency adjustment is achieved by switching the ratio of dividing frequency of PLL. The resolution of adjusting frequency is approximately 8Hz.

#### **2.4.5.2 VCO**

There are TX VCO and RX VCO.

The TX VCO (Q102) generates the carrier for the transmitter. The oscillation frequency of the VCO is half of transmit frequency. VCO oscillation frequency range is 381.5 to 435MHz. The transmit frequency range is 763 to 870MHz.

The RX VCO (Q104) generates the 1st local signal for the receiver. The oscillation frequency of the VCO is half of the 1st local signal for the receiver. VCO oscillation frequency range is 396.475 to 417.025MHz. The 1st local signal frequency range is 792.95 to 834.05MHz.

The VCO oscillation frequency is determined by voltage control terminals "CV" and "ASSIST".

The voltage control terminal "CV" is controlled by PLL IC (IC100). The voltage control terminal "ASSIST" is controlled by the control voltage from D/A converter (IC715).

For the modulation input terminal, "VCO\_MOD" of PLL (IC100), the output frequency changes according to the applied voltage. This is used to modulate the VCO output.

#### **2.4.5.3 PLL IC**

PLL IC (IC100) compare the difference in phases of the VCO oscillation signal and the TCXO reference frequency. And it returns the difference voltage to the VCO CV terminal and realizes the "Phase Locked Loop".

This allows the VCO oscillation frequency to accurately match (lock) the desired frequency.

When the frequency is controlled by the PLL, the frequency convergence time increases as the frequency difference increases when the set frequency is changed. To supplement this, the MPU is used before control by the PLL IC to bring the VCO oscillation frequency close to the desired frequency. As a result, the VCO CV voltage does not change and is always stable at approx. 2.5V.

The desired frequency is set for the PLL IC by the MPU (IC706) through the 3-line "SDO1", "P\_SCK1", "/PCS\_RF" serial bus for PLL. MPU monitors through the "PLD", whether the PLL IC is locked or not. If the VCO does not lock to desired frequency (unlock), the "PLD" logic is low.

#### **2.4.6 Control Circuit**

The control circuit consists of MPU/DSP (IC706) and its peripheral circuits. IC706 mainly performs the following:

- (1) Switching between transmission and reception by PTT signal input.
- (2) Reading system, zone, frequency, and program data from the memory circuit.
- (3) Sending frequency program data to the PLL.
- (4) Controlling the audio mute circuit by decode data input.

##### **2.4.6.1 MPU**

The MPU/DSP (IC706) is 32bit RISC processor and Fixed/Floating-Point VLIW DSP, equipped with peripheral function.

This MPU operates at 288MHz (MAX) clock and 3.3V/1.8V/1.2V DC. Controls the flash memory, Mobile DDR, the receive circuit, the transmitter circuit, the control circuit, and the display circuit and transfers data to or from an external device.

##### **2.4.6.2 Memory Circuit**

Memory circuit consists of the MPU and the Mobile DDR (IC702), the flash memory (IC701). The flash memory has capacity of 512Mbit that contains the transceiver control program for the MPU and stores the data.

It also stores the data for transceiver channels and operating parameter that are written by the FPU. This program can be easily written from external devices. The Mobile DDR has capacity of 512Mbit. The MPU copies the program to the Mobile DDR from Flash memory. And MPU is used as a work area Mobile DDR.

###### **■Flash memory**

###### **Note:**

The flash memory stores the data that is written by the FPU (KPG-D1/D1N), tuning data (Deviation, Squelch, etc.) , and firmware program (User mode, Test mode, Tuning mode, etc.). This data must be rewritten when replacing the flash memory.

###### **■Mobile DDR (static memory)**

###### **Note:**

Mobile DDR is used as a work area of the MPU.

#### 2.4.7 Power Supply Circuit

+B is connected to RF Power Module, 50BU regulator (Q8, Q9 and D11) through the fuse (F1), DC/DC converter IC (IC8) via fuse (F1), SB1 switch (Q5 and Q6) through the fuse (F2) and SB2 switch (Q10) through the fuse (F3).

Q8, Q9 and D11 regulates +B voltage to 5V (50BU). Then IC1 regulates 50BU to 3.1V (31BU). Then IC3 regulates 31BU to 1.2V (12BU). 50BU, 31BU and 12BU operate whenever +B is supplied.

IC8 regulates +B voltage to 5.4V (54M). 54M is controlled by BAT\_CNT signal from Power management IC (IC2). When Power switch is turned on, BAR\_CNT signal is controlled by /PSW signal. 54M goes to AVR ICs (A1, IC11, IC5, IC4, IC12, IC14, IC7, IC10, IC6 and IC17).

A1 (12M) is enabled while the 54M is operating. 12M provides the power to the MPU/DSP (IC706) and turns on IC11 (18M). 18M provides the power to the MPU/DSP and Mobile DDR (IC702) and turns on IC5 (33M), IC14 (33OPT). 33M provides the power to the MPU/DSP, Flash memory (IC701) and many control circuits and turns on IC4 (33A), IC10 (50A). Then 33A turns on IC9 (18M\_3).

The Power management IC (IC2) watches +B voltage. If +B voltage is higher than 6.2V, IC2 outputs high voltage to the /BINT terminal. If the /BINT is high, SB1 (Q5 and Q6) and SB2 (Q10 and Q11) are turned on by SBC\_2 signal from MPU. In the same way, IC12 (33C) and IC6 (50C) are turned on by SBC\_2. 50C is fed to IC13 (200C). IC13 (200C) is the DC/DC boost converter. The 200C circuit then outputs approximately +20VDC.

SB1 supplies SUB unit and MAIN unit B/2 (D-sub unit) with +B voltage. SB2 supplies Audio power amplifier (IC911) and 9V AVR (IC15) with +B voltage. Then IC15 regulates +B to 9V (90C). Then IC16 regulates 90C to 5V (50CT). If the MPU controls TXC, ANT SW and ASSW signals to High, Q15, Q16 (90T), Q17, Q18 (90ANT) and Q14 are turned on and transmission circuits are enabled to transmit. If the MPU controls RXC signal to High, IC17 (50R) is turned on and reception circuits are enabled to receive.

When the Power management IC and MPU detect /PSW signal (Power switch), /IGN signal (Ignition sense) and /BINT signal, they set the SBC\_2 signal to Low, and turn the transceiver power off.

When D1, Q4 detect over-voltage condition, they turn SB1 and SB2 off, and transfer that the MPU through IC2.

In RX the 2X is always used.

In GFSK TX if power is >10dBm then OSLO is used

In EDR2 TX if power is >-12dBm then OSLO is used

In EDR3 TX if power is >-12dBm then OSLO is used

Otherwise 2X is used for TX as well.

## SECTION 3 DISASSEMBLY

### 3.1 Precautions for Disassembly

#### 3.1.1 Main PCB (Main unit A/2) disassembly

- (1) Remove all screws and antenna terminals on the Main PCB.
- (2) Rotate the bush of the power supply cable 90 degrees counterclockwise as viewed from the rear of the chassis <1> and remove the power supply cable from the chassis <2>.
- (3) When the speaker phone jack is pushed up, using your finger, from the rear of the chassis <3>, the Main PCB is removed from the chassis.

**Note:**

The Main PCB and D-sub PCB (Main unit B/2) are connected with a flat cable.

Remove them carefully.

- (4) Turn the Main PCB over and remove the flat cable from the connector (CN906). <4>
- (5) Remove the Main PCB from the chassis.

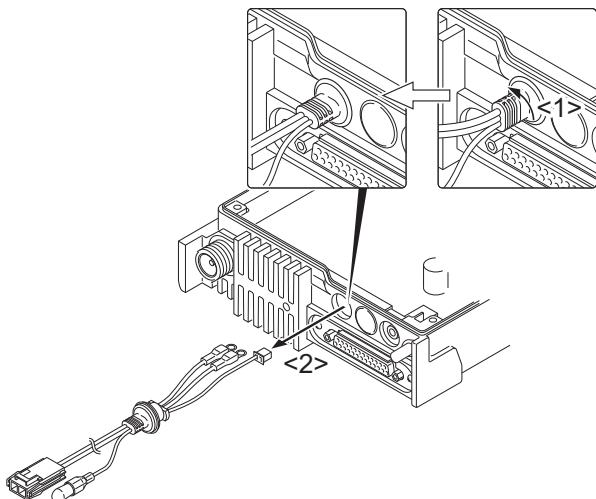

Fig.1-1

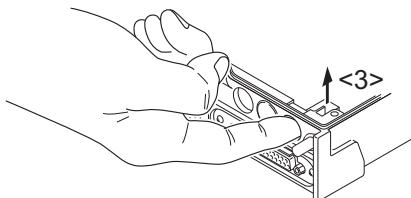

Fig.1-2

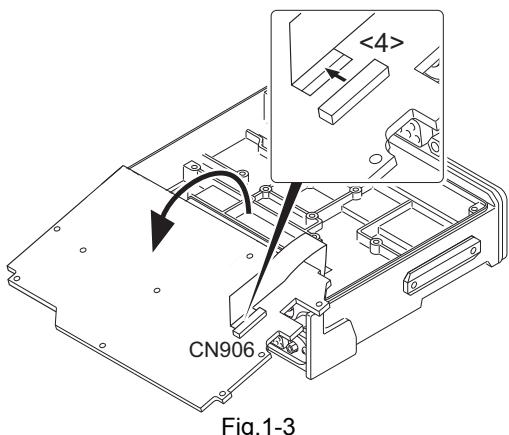

Fig.1-3

#### 3.1.2 Removing the speaker hardware fixture (J2B-0023-00) and holder (J1K-0019-00)

- (1) Remove the speaker lead from the holder hook. <1>
- (2) Remove the speaker connector from the display unit connector (CN5). <2>
- (3) When removing the speaker hardware fixture, insert a flat-head screwdriver at the position shown in Figure 2-1 and tilt it in the direction shown by the arrow. <3>
- (4) To remove the holder, insert a flat-head screwdriver into tab of the holder and tilt it in the direction shown by the arrow. <4>

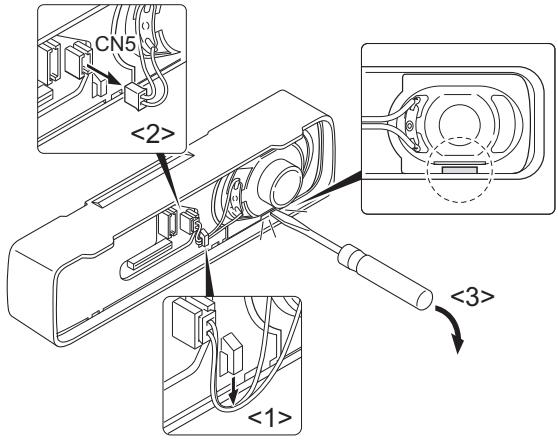

Fig.2-1

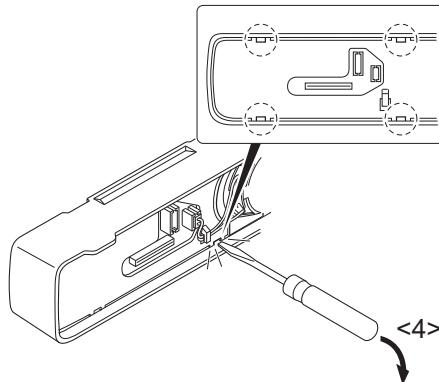

Fig.2-2

### 3.2 Precautions for Reassembly

#### 3.2.1 Main PCB (Main unit A/2) reassembly

- (1) With the Main PCB turned over, insert the flat cable from the D-sub PCB (Main unit B/2) into the connector (CN906) on the Main PCB.
- (2) Place the Main PCB at its original position as shown in Figure 3.

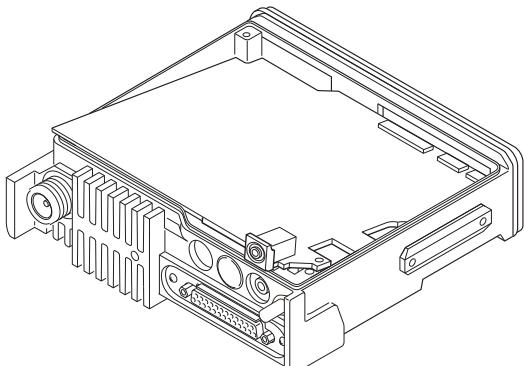

Fig.3

#### 3.2.2 Power supply cable installation procedure

- (1) Pass the power supply cable through the chassis hole <1> as shown in Figure 4-1 and insert the bush into the chassis hole.
- (2) Rotate the bush of the power supply cable 90 degrees clockwise as viewed from the rear of the chassis. <2>
- (3) Align the ignition sense connector (yellow) of the power supply cable around the chemical capacitor (C401) and connect it to the Main unit (A/2) connector (CN4).
- (4) Align the + (positive) terminal of the power supply cable (red) as shown in Figure 4-2 and fix it to the terminal strip with a screw.
- (5) Align the - (negative) terminal of the power supply cable (black) as shown in Figure 4-2 and fix it to the terminal strip with a screw.

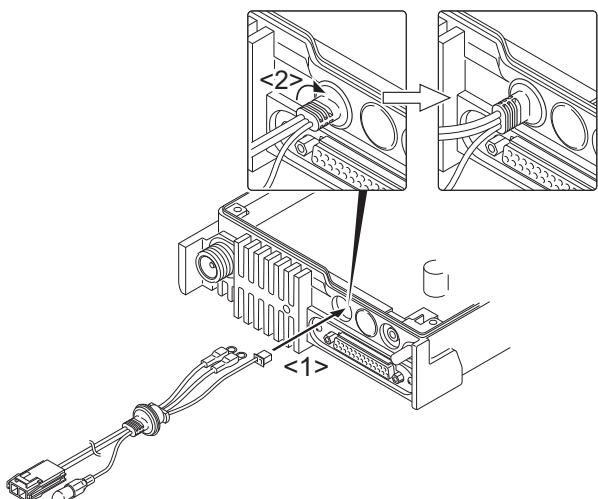

Fig.4-1

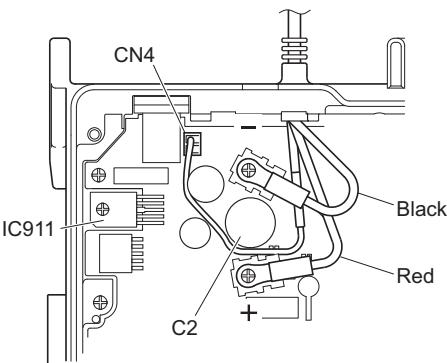

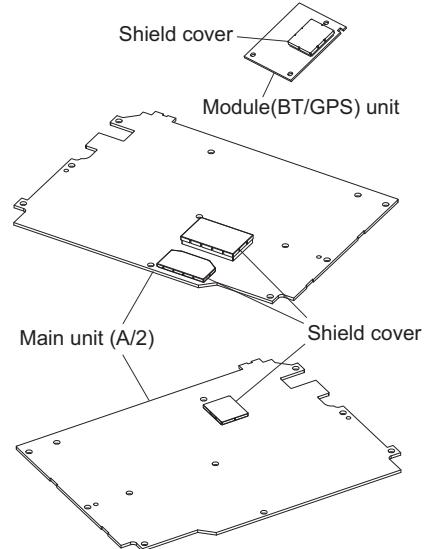

Fig.4-2

#### 3.2.3 Remove the top cover from the shield cover

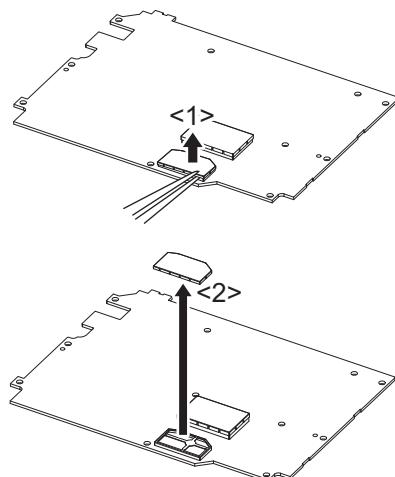

- (1) There are five shield covers on the Main unit (A/2) and Module (BT/GPS) unit, the top covers can be removed.

- (2) Use tweezers to slightly lift the edge of the top cover. <1>
- (3) As you do step 2 above, vary the position you hold the top cover as you lift it, and remove the top cover <2>.

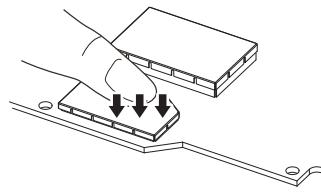

**Note:**

Once the top cover is removed, it cannot be used again.

#### Note:

Push evenly on the top cover and be careful that you do not bend it as you install it on the shield cover.

#### 3.2.4 Top packing installation procedure

- (1) Place the top packing over the shielding plate.
- (2) Fit the convex tab of the top packing into the hollow of the chassis. <1>.
- (3) Fit the chassis into the groove of the top packing. <2>  
Verify that the top packing is in close contact with the chassis.

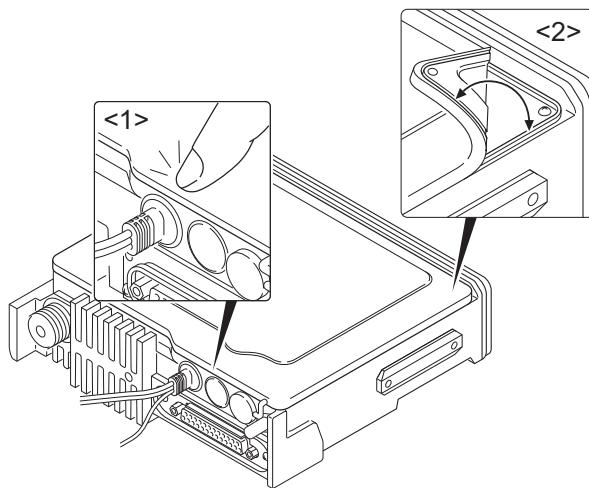

Fig.5

#### 3.2.5 D-sub cap installation procedure

To improve water resistance, fit the D-sub cap into the D-sub terminal hardware fixture of the transceiver in the following order:

- (1) Fit the left side <1> of the D-sub cap into the hardware fixture.
- (2) Fit the right side <2> of the D-sub cap into the hardware fixture.
- (3) Fit the center <3> of the D-sub cap into the hardware fixture.  
Verify that the D-sub cap is in close contact with the hardware fixture.

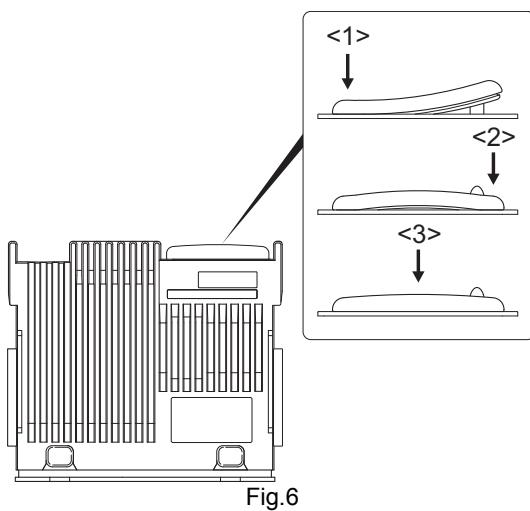

Fig.6

#### 3.2.6 Installing the holder (J1K-0019-00) and speaker hardware fixture (J2B-0023-00)

- (1) Insert two tabs of the holder (J1K-0019-00) into the hollows in the top of the panel. <1>
- (2) Push the two tabs of the holder in on the opposite side of those in step 1 above and fit them into the hollow in the bottom of the panel. <2>

#### Note:

Push in the holder until it snaps in place.

- (3) Install the speaker holder onto the panel. <3>

#### Note:

To improve water resistance, fit the panel into the groove of the holder.

- (4) Place the speaker into the speaker holder.

#### Note:

The speaker must not ride on the holder rib.

- (5) Place the spacer on the speaker.
- (6) Insert the hardware fixture (J2B-0023-00) into the hollow of the panel as shown in Figure 7-3, then push two parts of the hardware fixture and fit it into the hollow of the top of the panel. (Fig. 7-3 <4>)

#### Note:

Push in the hardware fixture until it snaps in place.

- (7) Insert the speaker connector into the display unit connector (CN5).
- (8) Place the speaker lead on the holder hook.

## SECTION 4 ADJUSTMENT

### 4.1 Controls

KMC-36 (OPTION)

#### 4.1.1 Preparations for checking/tuning the transceiver

Before attempting to check/tune the transceiver, connect the unit to a suitable power supply. Whenever the transmitter is turned on, the unit must be connected to a suitable dummy load (i.e. power meter). The speaker output connector must be terminated with an 4Ω dummy load and connected to an AC voltmeter and an audio distortion meter or a SINAD measurement meter at all times during checking/tuning.

### 4.2 Panel Test Mode

#### 4.2.1 Test mode operation features

This transceiver has a test mode. To enter test mode, press and hold the [➡] key while turning the transceiver power ON. Before the transceiver enters test mode, the frequency version information appears on the LCD momentarily. Test mode can be inhibited by programming. To exit test mode, turn the transceiver power OFF. The following functions are available in test mode.

- When the panel test mode is activated, the last used channel and signaling numbers are displayed. When the panel test mode is activated for the first time, the channel and signaling numbers are 1.
- If test signaling 10 (P25 Phase1), 7 (P25 Phase2) and 7 (NXDN Mode) is selected, the result of Bit Error Rate (BER) calculation is displayed on the LCD.

### 4.3.6 Panel tuning mode flow chart

**Note:**

\* In this Panel tuning mode flow chart, the Adjustment item name is modified.

#### 4.4 BER (Bit Error Rate) Measurement

- (1) The Panel Test Mode is used to measure the BER (Refer "4.2.1 Test mode operation features").
- (2) Select "10" (P25 Phase1), "7" (P25 Phase2) and "7" (NXDN Mode) for test signaling (Refer to "4.2.3 Frequency and Signaling" (2) Test signaling).

**Note:**

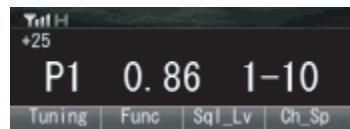

"7" (NXDN Mode) can be selected only by PC test mode.

- (3) Select a bandwidth (Narrow/Very Narrow) by pressing the [ ▶ ] key. When P25 Phase1 or P25 Phase2 is selected, it is not necessary to select a bandwidth.
- (4) Select a test frequency ("4.2.3 Frequency and Signaling" (2) Test signaling Test frequency).

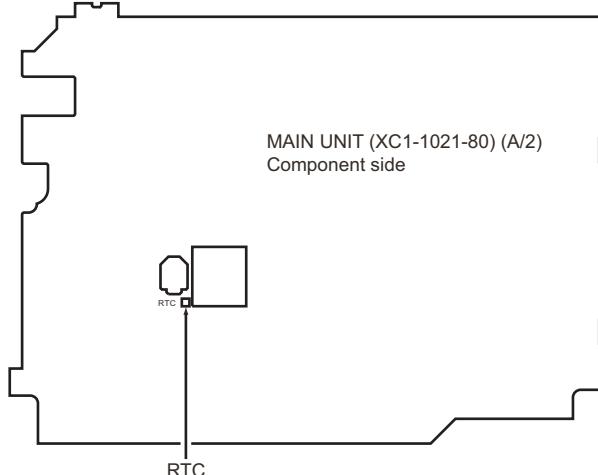

- (5) Measure the BER (Bit Error Rate) using the digital radio tester.  
Enter a standard input signal into the transceiver as a standard tone test pattern for P25, FSW+PN9 for NXDN.
- (6) Adjust the input signal level to achieve the standard bit error rate (BER).

(For example, if the BER is 0.86%, the display shows "0.86".)

#### 4.9.1 Necessary Deviation adjustment item for each signaling and mode

The following shows the necessary adjustment items for each signaling deviation. Please read the following table like the following example. In the case of the signaling "QT (Wide 5k)", this signaling is composed of three elements [Balance, Maximum Deviation (Analog Wide 5k) and QT Deviation (Wide 5k)]. Please adjust Balance and Maximum Deviation (Analog Wide 5k) before adjusting QT Deviation (Wide 5k).

Mode	Signaling	Necessary adjustment and order

## TROUBLESHOOTING

### 5.1 Fault Diagnosis of the BGA (Ball Grid Array) IC

#### ■Overview

A flowchart for determining whether or not the transceiver can be powered on (the LCD does not function even if the power switch is turned on) due to broken BGA parts.

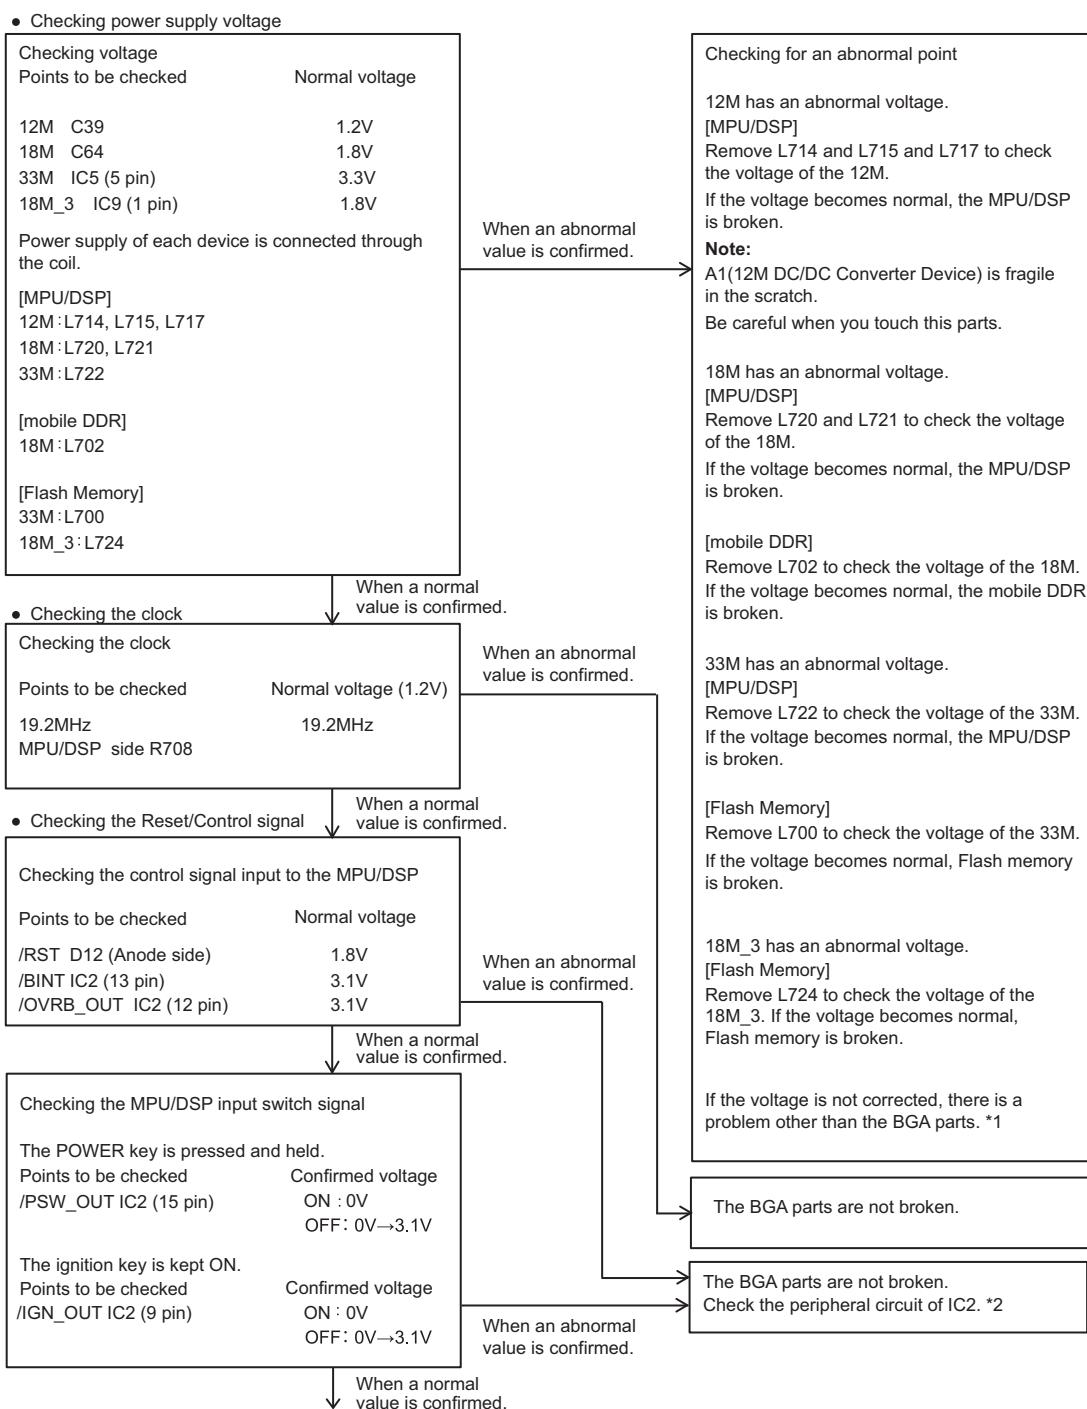

#### ■BGA parts

MPU/DSP (IC706), mobile DDR (IC702), Flash memory (IC701)

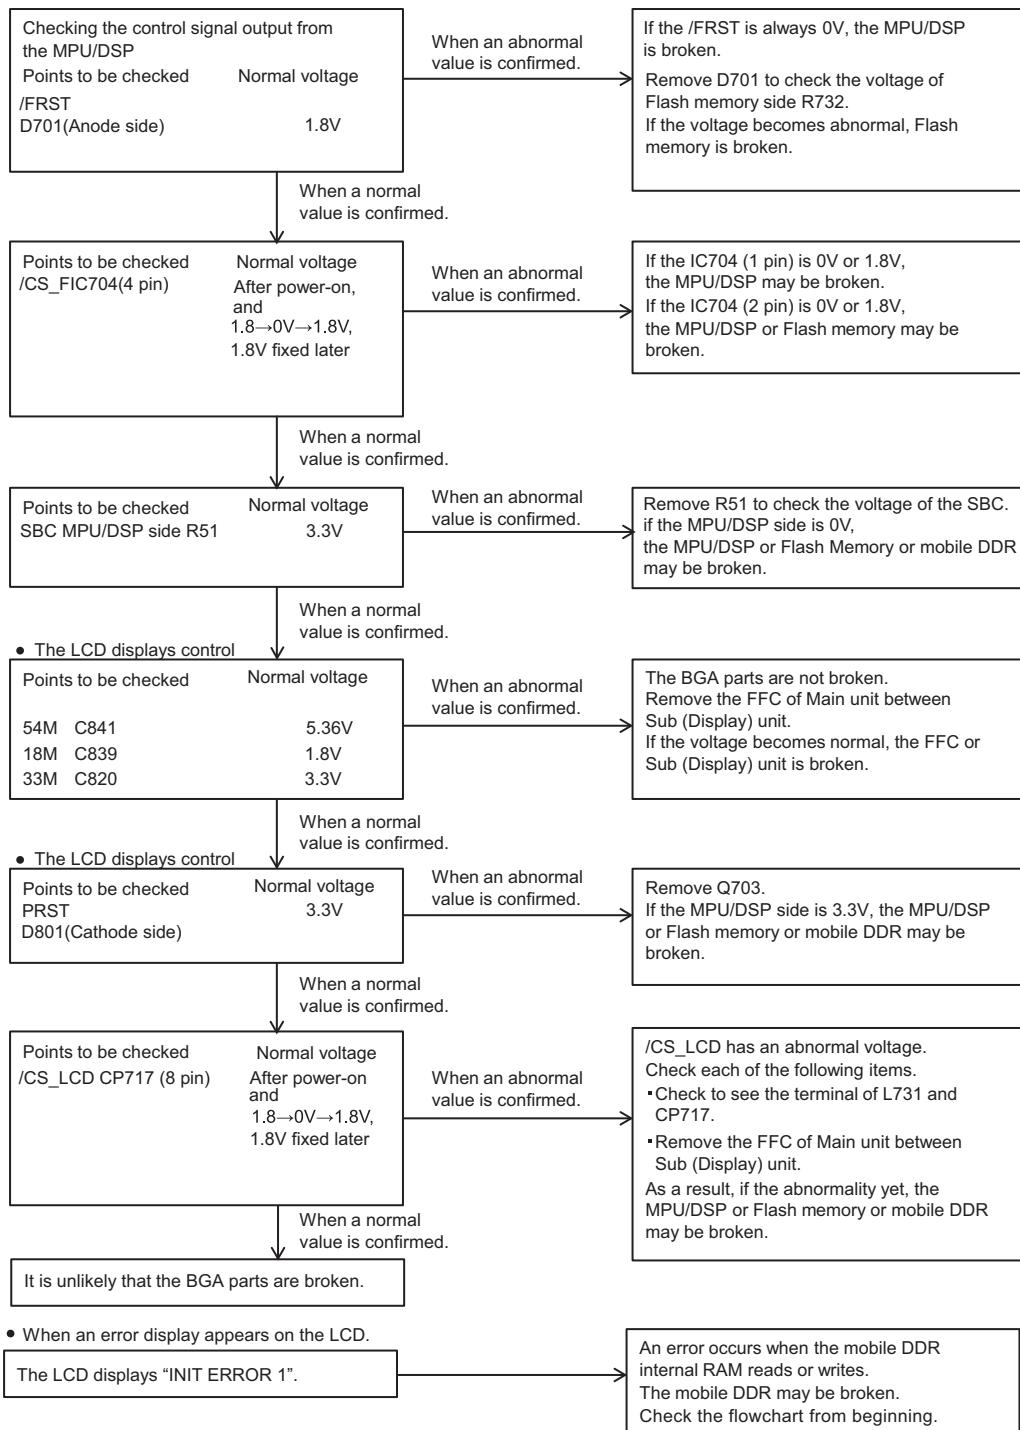

When the BGA IC is problematic, please bring the printed circuit board (XC1-1021-81) in for service. Various ESN/ default adjustment values are written on the printed circuit board for service.

Additionally various ESN stickers are included. (Please refer to "5.4 Replacing Main Unit".)

After the printed circuit board has been readjusted, please attach any ESN stickers to the chassis. When "ESN Validation" is used, you must modify the ESN register.

- Checking the output signal from the MPU/DSP.

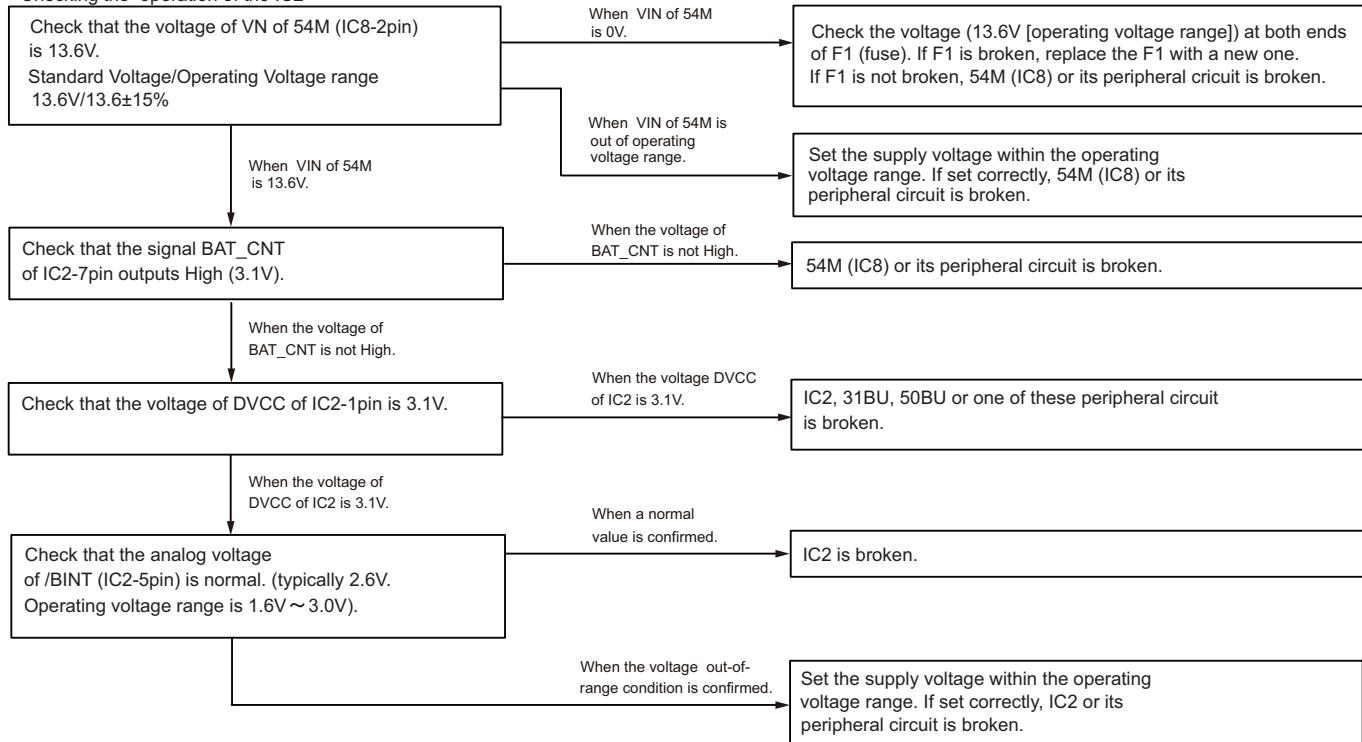

#### ■ Descriptions of signal names

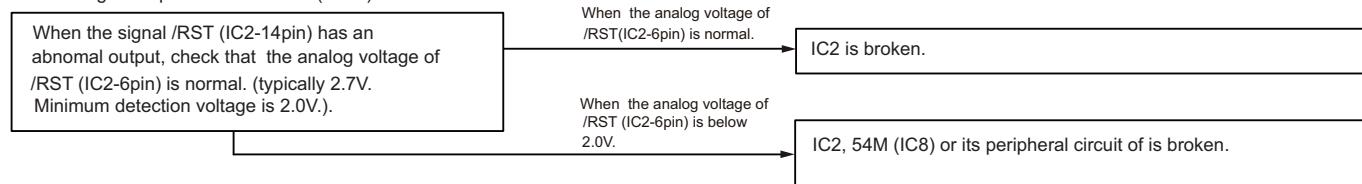

(1) /RST	:MPU/DSP reset signal	LOW → Reset
(2) /BINT	:Battery final voltage monitoring	LOW → Final voltage
(3) /OVRB_OUT	:Battery overvoltage monitoring	LOW → Overvoltage
(4) /PSW_OUT	:Power switch signal	LOW → ON
(5) /IGN_OUT	:Ignition switch signal	LOW → ON
(6) /FRST	:Flash Memory reset signal	LOW → Reset
(7) /CS_F	:Flash Memory chip select signal	LOW → Active
(8) SBC	:Switch +B control	HIGH → ON
(9) 30LCD	:LCD module control 3.0V power supply	
(10) PRST	:LCD reset signal	LOW → Reset
(11) /CS_LCD	:LCD controller chip select signal	LOW → Active

\*1 If 12M, 18M or 33M has still abnormal voltage after the implementation of each procedure above, 54M(IC8), 12M(A1), 18M(IC11), 33M(IC5) or one of these peripheral circuit is broken.  
 54M (normally 5.4V at L12) has an abnormal voltage, check the MSP430G25KGCA (IC2) according to the following procedure.

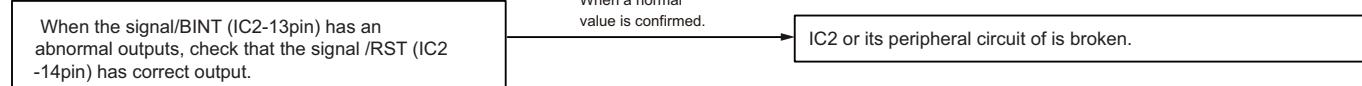

• Checking the operation of the IC2

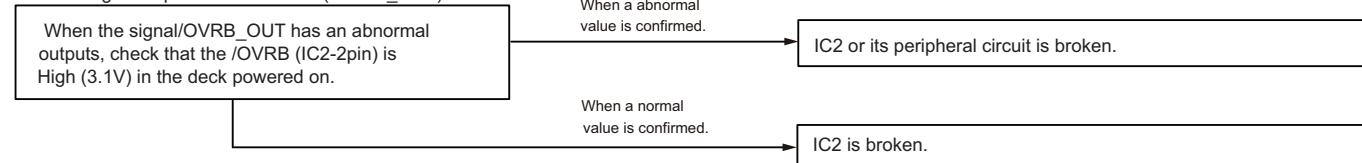

\*2 • Checking the operation of the IC2 (/RST)

• Checking the operation of the IC2 (/BINT)

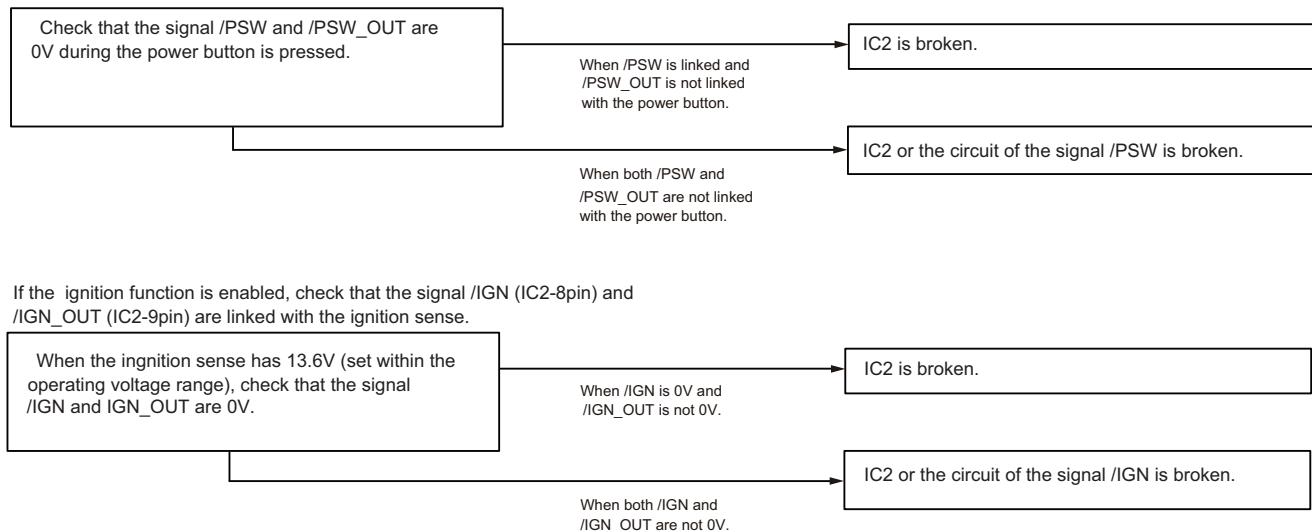

• Checking the operation of the IC2 (/OVRB\_OUT)

● Checking the operation of IC2 (/PSW and /IGN)

Check that the signal /PSW (IC2-10pin) and /PSW\_OUT (IC2-15pin) are linked with the power button on KCH-19 in power on state.

■ Remarks related MSP430G25KGCA

A. MSP430G25KGCA is written the program.

B. OMAP communicates with MSP430G25KGCA by serial communication at startup of deck.

Only firmware version of MSP430G25KGCA is confirmed OMAP in serial communication.

Even when firmware version of MSP430G25KGCA can not be acquired, the system of MSP430G25KGCA is started.

C. If there is the difference of firmware version of MSP430G25KGCA between MSP430G25KGCA and OMAP,

the firmware version of MSP430G25KGCA is updated with the serial communication by OMAP.

"WAIT--" is displayed on the LCD during the firmware update. When the firmware update fails,

the system of MSP430G25KGCA is started and OMAP is trying to update again at next startup.

## 5.4 Replacing Main Unit

### ■Main unit Information

Model Name	Original Main unit Number	For Service Main unit Number
NX-5900 (F,K)	XC1-1021-80	XC1-1021-81

### ■Method of confirming “Original Main unit” and “Service Main unit”

The 0Ω resistor (R1) is mounted on the “R1” silk print part of the Service Main unit (XC1-1021-81).

#### Note:

- The 0Ω resistor (R1) is used to differentiate the destination with a visual check. These are not connected with any PCB pattern; they are specifically for production control. There is no need to change the mount of these resistors.
- There is no difference between the schematic diagram of the Service Main unit (XC1-1021-81) and the schematic diagram of the original Main unit (XC1-1021-80). (R1 is connected with GND (ground) only.)

### ■Supplied Accessories of “Service Main unit”

Item (Including Parts Number)	Quantity
Main Unit (XC1-102)	1
KENWOOD ESN/ NXDN ESN/ Product Number/ MPT ESN/ P25 ESN Label	1

### ■Service Main unit” Data

The following data is written on the service unit:

Data Type	Description
Firmware	NX-5900 Firmware.
FPU Data (PC programming mode)	XC1-102 (NX-5900) F type data.
Various Adjustment Data (PC Test mode)	General adjustment values for the XC1-102 (NX-5900) .
KENWOOD ESN	Model name: [XC1-102] NX-5900S Type: F The same number as the KENWOOD ESN label is written.
NXDN ESN/MPT ESN/ Product number/ P25 ESN	The same number as the NXDN ESN/ MPT ESN/Product Number/P25 ESN label is written.

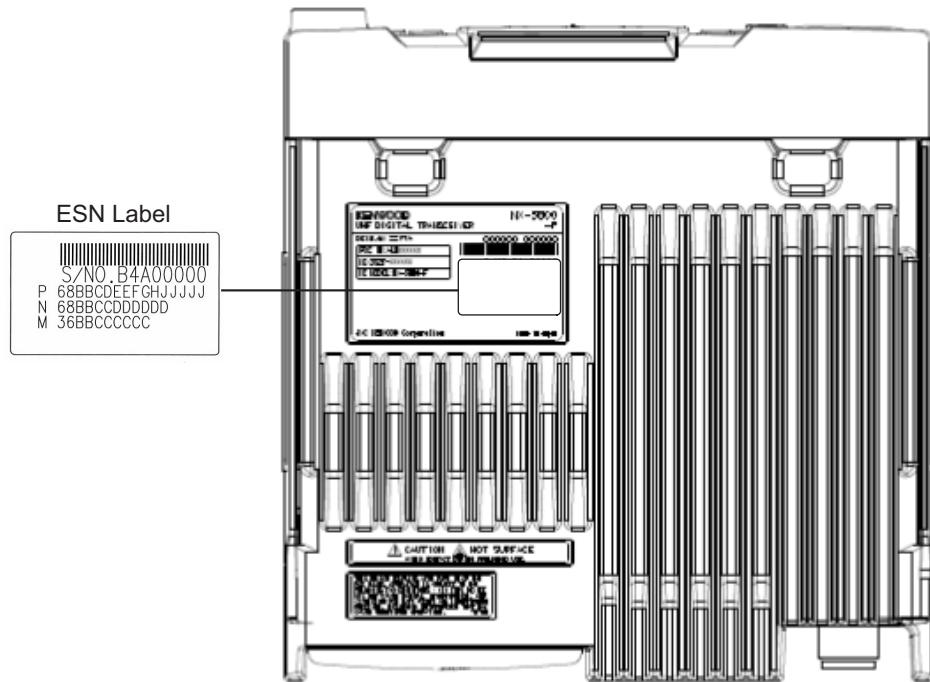

### ■After Changing the PCB

- After changing the printed circuit board, write the up-to-date Firmware following the instructions in the “2.2 RE-ALIGNMENT - 2.2.6 Firmware Programming Mode”.
  - Write the Firmware in accordance to the Market. If you write different Market Firmware, there are times communication with the FPU is not possible.
- Using the KPG-D1/D1N, select your desired item (Model Name and Frequency) from the Model> Product Information menu, then use Program> Write Data to the Transceiver to write the FPU data (PC Programming mode). When writing to the transceiver, a Warning Message, corresponding to the item selected, appears. Click [OK] to continue writing the data.
- Enter Program> Test Mode, then adjust the various adjustment data (PC Test Mode) as described in the “SECTION 4 ADJUSTMENT”.
- Attach the new labels corresponding to the new printed circuit board. (Refer to the images below for label placement.)
- If necessary, write the FPU data used by the customer with the KPG-D1/D1N.

**Note:**

- When using the ESN Validation function of NXDN Trunking, the NXDN ESN number changes when the circuit board is changed (the number is written on the circuit board); the NXDN Trunking System cannot be accessed. Use the KPG-110SM on the NXDN Trunking System side to reprogram the NXDN ESN number.

- When a new printed circuit board is used, the KENWOOD ESN changes, as does the Transceiver Information display of the KPG-D1/D1N, but this does not have any effect on the operation of the transceiver.
- If changing to the original ESN, please contact our service center.

## 5.5 Failure diagnosis of the Transmitter section

**Overview:**

When the Transmitter section does not operate, use this flowchart to determine the problem.

**Confirmation before this failure diagnosis:**

Before attempting to diagnose the transmitter section, check the calibration of measurement equipments (i.e.power meter).

Whenever the transmitter is turn on, the unit must be mounted on the chassis and connected to a suitable dummy load.

**Major parts of the Transmitter section**

- Final FET (Q303)
- Drive FET (Q302)
- Power Control IC (IC302)
- ANT Switch Diode (D305, D306, D308)
- 90C AVR (IC15)
- 50CT AVR (IC16)
- Fuse (F300)

**Note:**

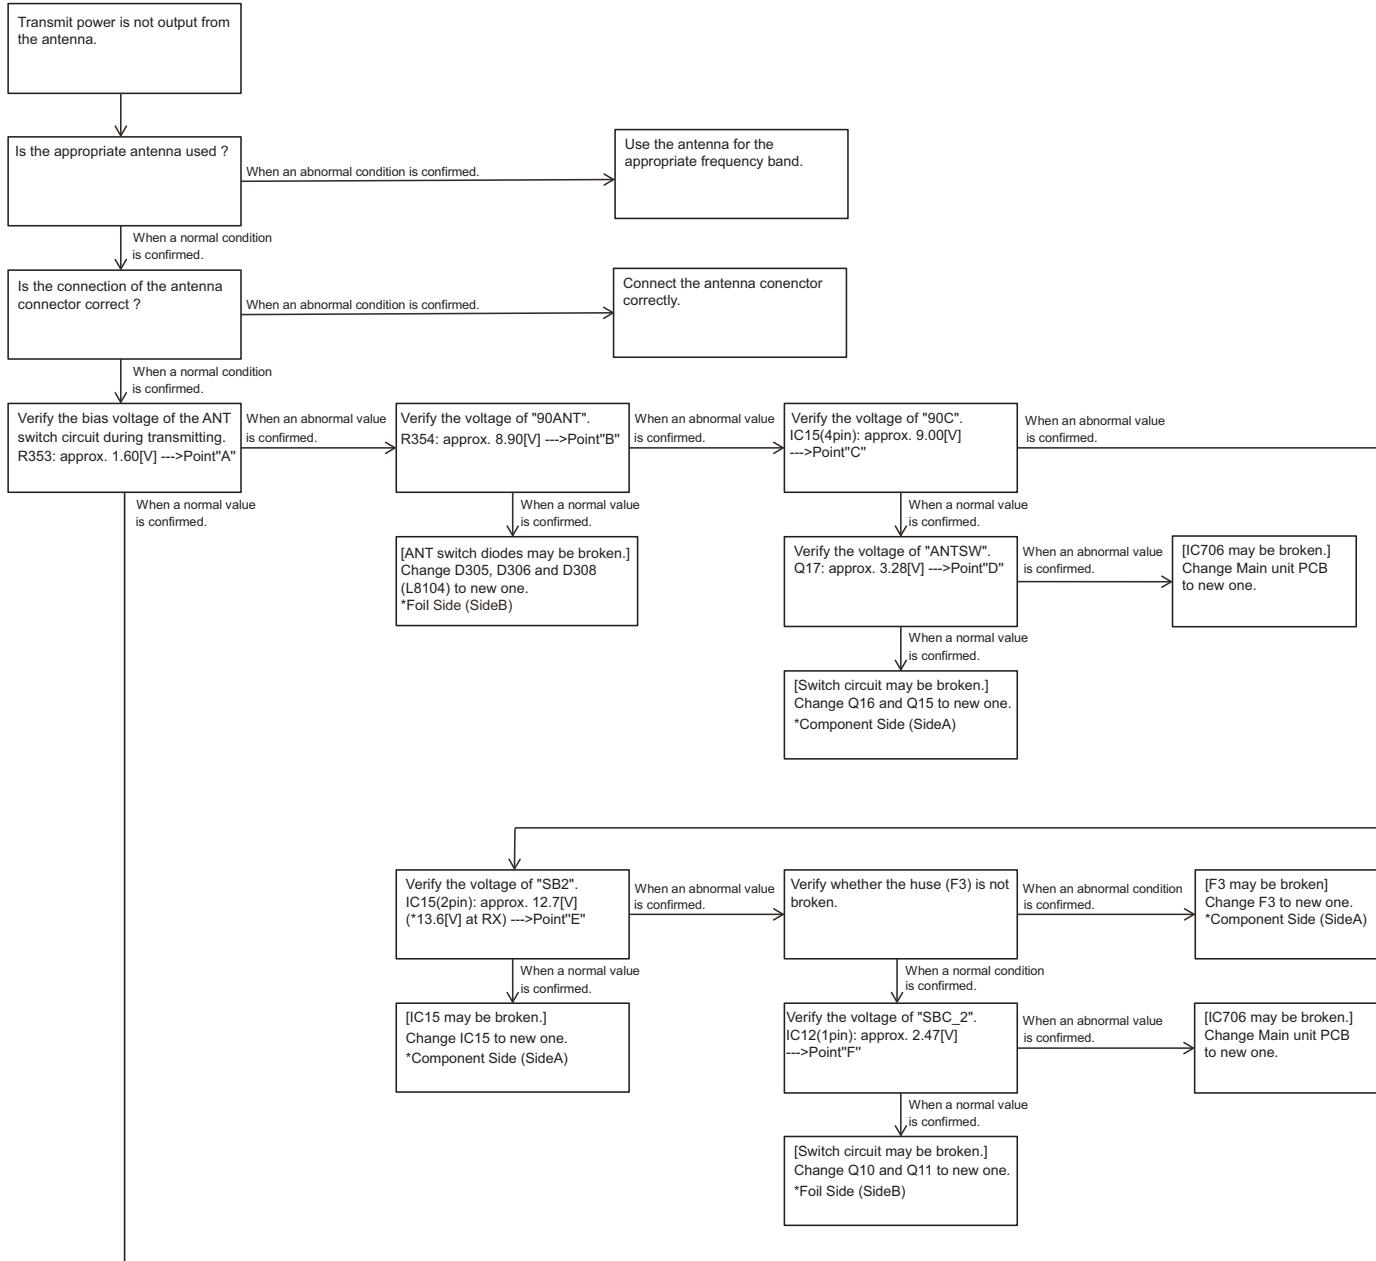

The Final FET is not able to be replaced using the service equipment, the Final FET is not registered as a service part.

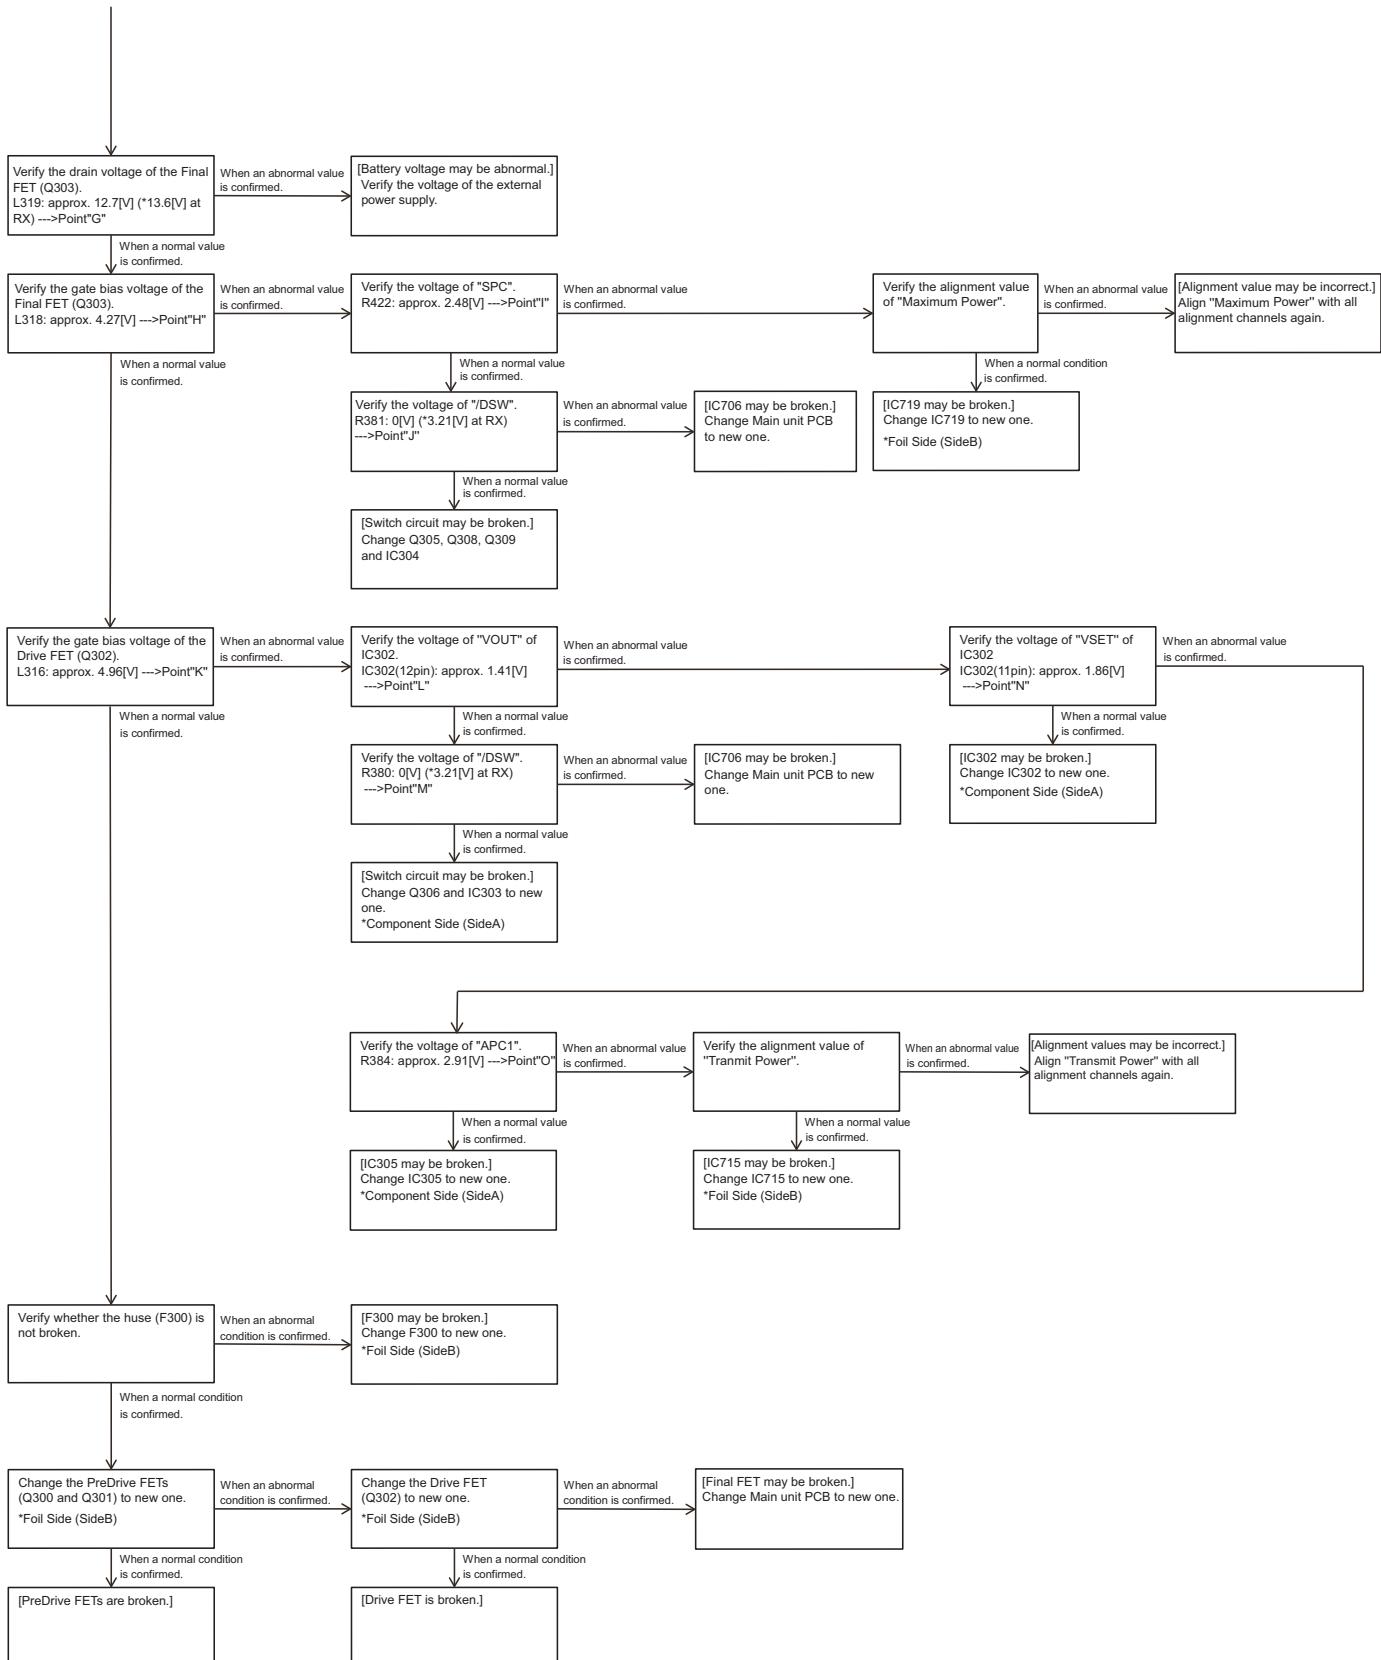

Therefore, the Main unit must be replaced by the Service Main unit when the Final FET is defective.

This Failure diagnosis of Transmitter section is created to judge a defective Final FET.

**Test Channel for the voltage verification**

Test Channel 1-1 (TX frequency: 793.05MHz)\_HighPower
