SPLIT SYSTEM AIR CONDITIONER

Indoor Unit

Outdoor Unit

C3622

SERVICE MANUAL

V3622 / C3622

(Expanded Information)

IMPORTANT! Please Read Before Starting

This air conditioning system meets strict safety and operating standards. As the installer or service person, it is an important part of your job to install or service the system so it operates safely and efficiently.

For safe installation and trouble-free operation, you must:

- Carefully read this instruction booklet before beginning
- Follow each installation or repair step exactly as shown
- Observe all local, state, and national electrical codes
- Pay close attention to all warning and caution notices given in this manual

This symbol refers to a hazard or unsafe practice which can result in severe personal injury or death.

This symbol refers to a hazard or unsafe practice which can result in personal injury or product or property damage.

If Necessary, Get Help

These instructions are all you need for most installation sites and maintenance conditions. If you require help for a special problem, contact our sales/service outlet or your certified dealer for additional instructions.

In Case of Improper Installation

The manufacturer shall in no way be responsible for improper installation or maintenance service, including failure to follow the instructions in this document.

SPECIAL PRECAUTIONS

When Wiring

ELECTRICAL SHOCK CAN CAUSE SEVERE PERSONAL INJURY OR DEATH. ONLY A QUALIFIED, EXPERIENCED ELECTRICIAN SHOULD ATTEMPT TO WIRE THIS SYSTEM.

- Do not supply power to the unit until all wiring and tubing are completed or reconnected and checked.
- Highly dangerous electrical voltages are used in this system. Carefully refer to the wiring diagram and these instructions when wiring. Improper connections and inadequate grounding can cause accidental injury or death.
- · Ground the unit following local electrical codes.
- Connect all wiring tightly. Loose wiring may cause overheating at connection points and a possible fire hazard.

When Transporting

Be careful when picking up and moving the indoor and outdoor units. Get a partner to help, and bend your knees when lifting to reduce strain on your back. Sharp edges or thin aluminum fins on the air conditioner can cut your fingers.

When Installing...

...In a Ceiling or Wall

Make sure the ceiling/wall is strong enough to hold the unit's weight. It may be necessary to construct a strong wood or metal frame to provide added support.

...In a Room

Properly insulate any tubing run inside a room to prevent "sweating" that can cause dripping and water damage to walls and floors.

...In Moist or Uneven Locations

Use a raised concrete pad or concrete blocks to provide a solid, level foundation for the outdoor unit. This prevents water damage and abnormal vibration.

...In an Area with High Winds

Securely anchor the outdoor unit down with bolts and a metal frame. Provide a suitable air baffle.

...In a Snowy Area (for Heat Pump-type Systems)
Install the outdoor unit on a raised platform that is higher than drifting snow. Provide snow vents.

When Connecting Refrigerant Tubing

- · Keep all tubing runs as short as possible.
- · Use the flare method for connecting tubing.
- Apply refrigerant lubricant to the matching surfaces of the flare and union tubes before connecting them, then tighten the nut with a torque wrench for a leak-free connection.
- · Check carefully for leaks before starting the test run.

NOTE:

Depending on the system type, liquid and gas lines may be either narrow or wide. Therefore, to avoid confusion the refrigerant tubing for your particular model is specified as either "narrow" or "wide" rather than as "liquid" or "gas."

When Servicing

- Turn the power OFF at the main power box (mains) before opening the unit to check or repair electrical parts and wiring.
- Keep your fingers and clothing away from any moving parts.
- Clean up the site after you finish, remembering to check that no metal scraps or bits of wiring have been left inside the unit being serviced.

3. FUNCTION

3-1 Room Temperature Control

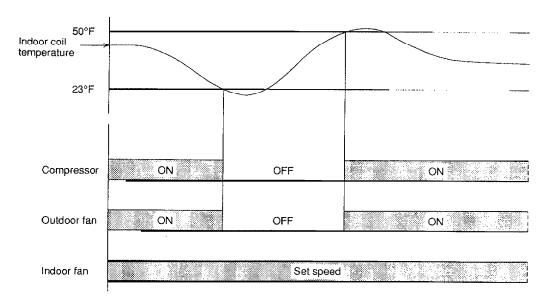

- Room temperature control is obtained by cycling the compressor ON and OFF under control of the room temperature sensor in the remote control unit.
- The compressor turns OFF below the setting temperature, and turns ON above the differential temperature (about 2°F).

• The control circuit will not attempt to turn the compressor ON until the compressor has been OFF for at least 3 minutes. To protect the compressor from stalling out when trying to start against the high side refrigerant pressure, the control circuit has a built-in automatic time delay to allow the internal pressure to equalize.

3-2 Freeze Prevention

• When the coil temperature falls below 23°F, the compressor turns OFF. When the coil temperature rises above 50°F, the compressor turns ON again.

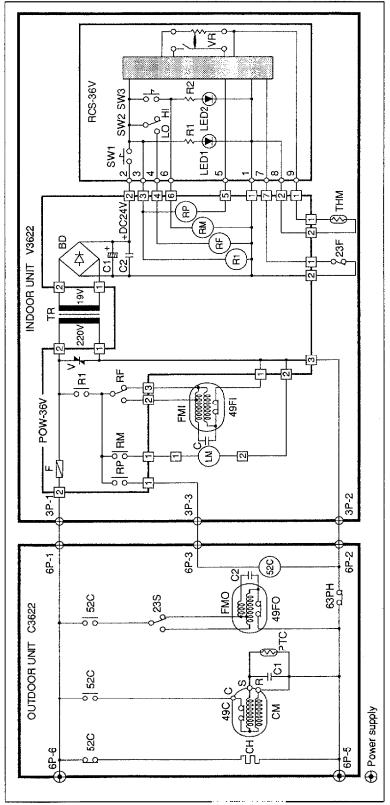

3-3 Outdoor Fan Speed Control

- In low temperature areas, the outdoor fan is set automatically to LOW to prevent freezing.
- When the outdoor air temperature falls below 75°F, the outdoor fan is set to LOW. When the outdoor air temperature rises to 79°F, the outdoor fan is set to HIGH.

5. TROUBLESHOOTING

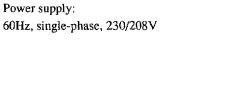

5-1 Check before and after troubleshooting.

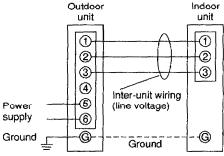

(1) Check power supply wiring.

 Check that power supply wires are correctly connected to terminals No. 5 and No. 6 on the 6P terminal plate in the outdoor unit.

(2) Check inter-unit wiring.

• Check that inter-unit wires are correctly connected to indoor unit from outdoor unit.

(3) Check power supply.

- Check that voltage is in specified range (±10% of the rating).
- Check that power is being supplied.

If the following troubleshooting must be done with power being supplied, be careful about any uninsulated live part that can cause ELECTRIC SHOCK.

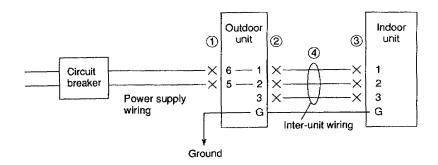

(4) Check lead wires and connectors in indoor and outdoor units.

- · Check that coating of lead wires is not damaged.
- Check that lead wires and connectors are connected firmly.
- Check that wiring is correct.

5-2 Air conditioner does not operate.

- (1) Circuit breaker trips (or fuse blows).
 - (a) When circuit breaker is set to ON, it trips in a few moments (resetting is not possible).
 - There is a possibility of ground fault.
 - Measure insulation resistance.

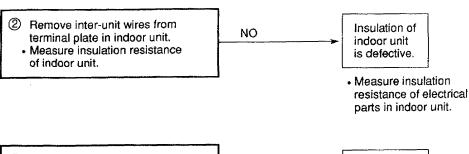

If resistance value is $1M\Omega$ or less, insulation is defective ("NO").

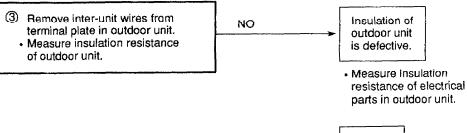

- *Set circuit breaker to OFF.
- Remove power supply wires from terminal plate in outdoor unit.
 Measure insulation resistance of power supply wires.

 NO

 Do rewiring.

(b) Circuit breaker trips in several minutes after turning air conditioner ON.

- There is a possibility of short circuit.
- Check capacity of circuit breaker.

 Is capacity of circuit breaker suitable?

 Replace it with suitable one (larger capacity).
- Measure resistance of compressor motor winding.

 Measure resistance of outdoor fan motor winding.

(2) Neither indoor unit nor outdoor unit runs.

(a) Power is not supplied.

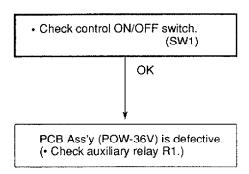

(b) Check fuse on the PCB Ass'y in indoor unit.

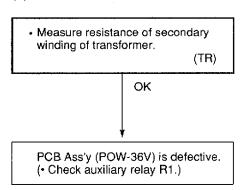

(Neither indoor unit nor outdoor unit runs.) (cont'd)

(c) Check control unit (RCS-36V).

Refer to control unit proper.

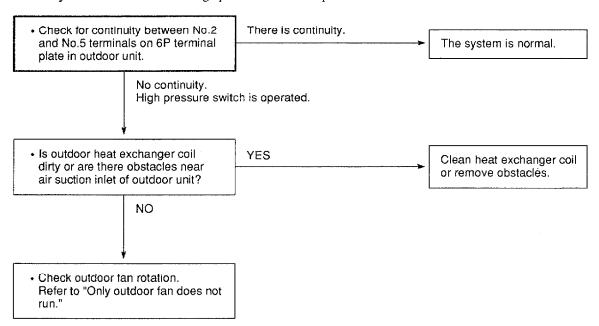

(d) Check transformer.

(e) Check high pressure switch (63PH).

• System does not run when high pressure switch is operated.

(3) Only outdoor unit does not run.

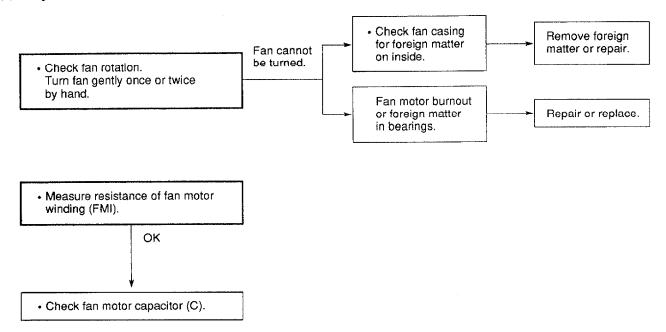

- (a) Outdoor unit does not run when air conditioner is in the following conditions.
 - In thermo OFF (when the room temperature is below the setting temperature).
 - In freeze prevention (when the freeze protection thermo is OFF).
- (b) Check electro-magnetic contactor (52C).
 - Measure coil resistance of electromagnetic contactor.
- (c) Check PCB Ass'y (POW-36V).
- Measure voltage between No.2 and No.3 terminals on 6P terminal plate in outdoor unit.

 No voltage registers.

 PCB Ass'y is defective.

5-3 A particular component of air conditioner does not operate.

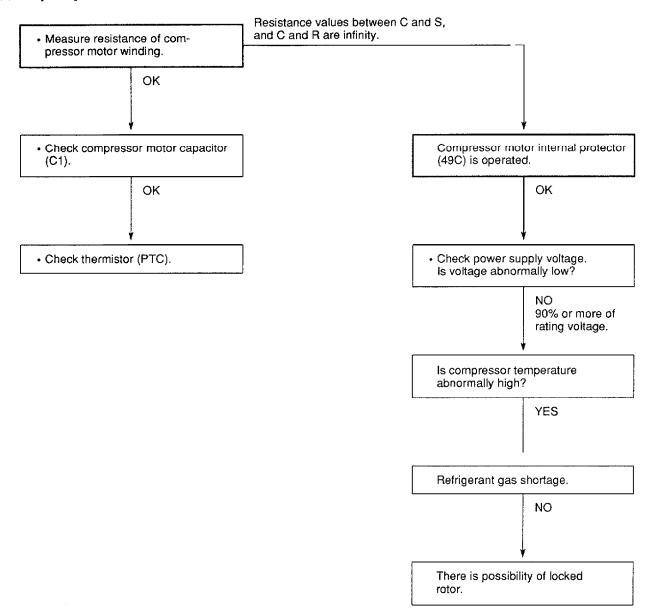

(1) Only indoor fan does not run.

(2) Only outdoor fan does not run.

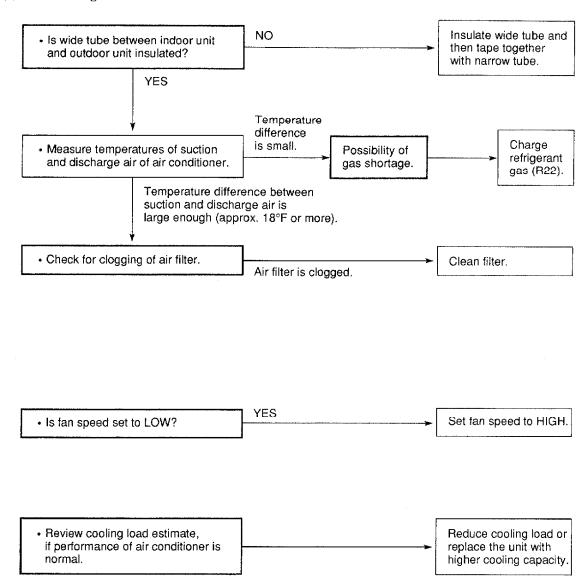

(3) Only compressor does not run.

5-4 Air conditioner operates, but abnormalities occur.

(1) Poor Cooling

(2) Excessive Cooling

Set thermostat knob to suitable position.

TEST RUN position is used for servicing the air conditioner. Do not set it to TEST RUN position during normal operation.

· Check thermistor (THM).

When the thermistor is open, the air conditioner does not stop running until the freeze protection thermostat is operated.

6. CHECKING ELECTRICAL COMPONENTS

6-1 Measurement of Insulation Resistance

• The insulation is in good condition if the resistance exceeds $1 M\Omega$.

(1) Power Supply Wires

Clamp the grounded wire of the power supply wires with the lead clip of the insulation resistance tester and measure the resistance by placing a probe on either of the power wires. (Fig. 1)

Then measure the resistance between the grounded wire and the other power wires. (Fig. 1)

(2) Indoor Unit

Clamp an aluminum plate fin or copper tube with the lead clip of the insulation resistance tester and measure the resistance by placing a probe on ①, and then ② on the terminal plate. (Fig. 2)

(3) Outdoor Unit

Clamp a metallic part of the unit with the lead clip of the insulation resistance tester and measure the resistance by placing a probe on ⑤, and then ⑥ on the terminal plate. (Fig. 2)

(4) Measurement of Insulation Resistance for Electrical Parts

Disconnect the lead wires of the desired electric part from terminal plate, PCB Ass'y, capacitor, etc. Similarly disconnect the connector. Then measure the insulation resistance. (Figs. 1 to 4)

Refer to Electric Wiring Diagram.

Note: If the probe cannot enter the poles because the hole is too narrow then use a probe with a thinner pin.

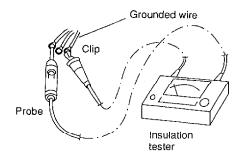

Fig. 1

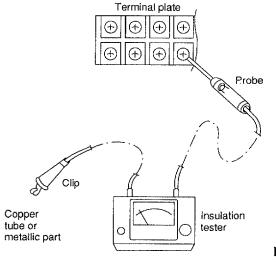

Fig. 2

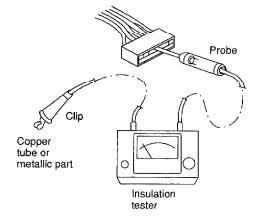

Fig. 3

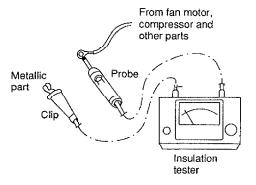

Fig. 4

6-2 Checking Continuity of Fuse on PCB Ass'y

 Check for continuity using a multimeter as shown in Fig. 5.

Note:

Method used to Replace Fuse on PCB Ass'y

- Remove the PCB Ass'y from the electrical component box.
- Pull out the fuse at the metal clasp using pliers while heating the soldered leads on the back side of the PCB Ass'y with a soldering iron (30W or 60W). (Fig. 6)
- 3. Remove the fuse ends one by one. For replacement, insert a fuse of the same rating and solder it. (Allow time to radiate heat during soldering so that the fuse does not melt.)

When replacing the fuse, be sure not to break down the varistor.

6-3 Checking Motor Capacitor

Remove the lead wires from the capacitor terminals, and then place a probe on the capacitor terminals as shown in Fig. 7. Observe the deflection of the pointer, setting the resistance measuring range of the multimeter to the maximum value.

The capacitor is "good" if the pointer bounces to a great extent and then gradually returns to its original position.

The range of deflection and deflection time differ according to the capacity of the capacitor.

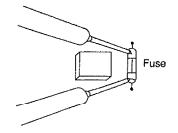

Fig. 5

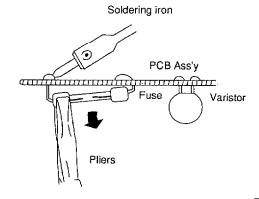

Fig. 6

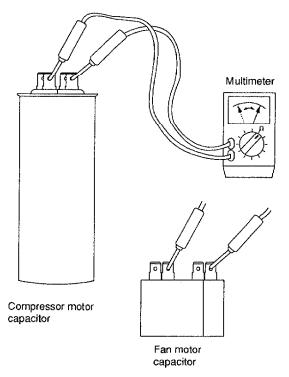

Fig. 7

6-4 Checking Control Unit (RCS-36V) Proper

First, pull out the connector (7P) of the remote control unit from the controller (POW-36V) in the indoor unit.
