# 1. Outline of Toshiba Super Modular Multi System (S-MMS)

## ◆ Branching

Combination of line and header branching is highly flexible. This allows for the shortest design route possible, thereby saving on installation time and cost. Line/header branching after header branching is only available with Toshiba Super MMS.

### Line branching

### Header branching

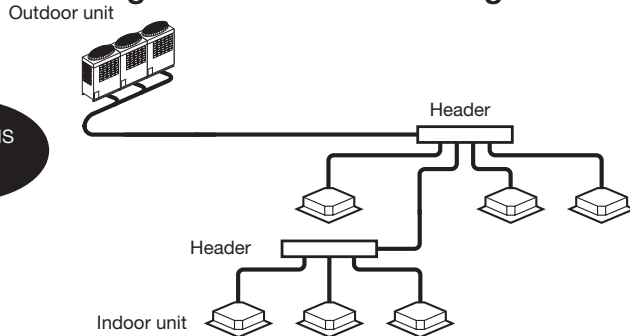

### Line and header branching

### Line branching after header branching

### Header branching after header branching

- Non-polarized control wiring between outdoor and indoor units

- Wiring diagnosis system  
Use the switches on the micro processor PCB of the outdoor unit.
  - Detects wiring to the indoor unit a4 which should not be in system A.
  - b4 is missing in system B.

### ◆ **Compact**

The design of the modular Toshiba Super MMS outdoor unit allows for easy unit manoeuvring into any standard lift. Its compactness also allows it to be easily installed in limited spaces.

### ◆ **Largest system capacity**

Toshiba Super MMS can be combined up to 48 hp (135 kW) as one refrigerant system.

### ◆ **Energy saving design**

The units have the best energy efficiency ratio of any VRF unit. Compared with a conventional chiller fan coil system, a large energy saving can be realized.

### ◆ **Advanced bus communication system**

Wiring between indoor and outdoor units is a simple 2-wire system. The communication address is also automatically configured. A default test mode operation is available.

### ◆ **Self-diagnostic system**

Comprehensive troubleshooting code enables quick identification of problems arising.

### ◆ **High lift design**

An equivalent pipe length of 175 m and vertical lift of 50 m are possible with the Toshiba Super MMS.

The vertical lift between indoor units of 30 m is the highest in the industry. This allows for greater flexibility in the location of the system.

### ◆ **Multiple indoor units**

Indoor units with different capacities and configurations can be combined up to 135% of the outdoor unit capacity.

A maximum of 48 indoor units can be combined with the 30-48 hp outdoor units.

### ◆ **Intelligent control**

Toshiba Super MMS intelligent controls and modulating valves deliver the required capacity, in accordance with the load variation from 50% to 100%.

The intelligent controls and modulating valves limit or increase the cooling capacity dynamically so humidity and temperature are kept in the comfort zone.

### ◆ **Wide control applications**

Artificial Intelligence Network system

- Central control and monitoring system available
- Weekly schedule operation through weekly timer

Integration with a Building Management System (BMS) is available.

## 2. Summary of system equipment

Connection piping	Corresponding dia. (mm)	Q'ty													
Balance pipe	Ø3/8"	1													
Liquid side piping	Ø3/8" to Ø7/8"	1													
Gas side piping	Ø5/8" to Ø1-5/8"	1													

\*1 The capacity code can be obtained from page 10 (capacity code is not actual capacity).

\*2 If total capacity code value of indoor unit exceeds that of outdoor unit, apply capacity code of outdoor unit.

\*3 When using Y-shape branching joint for 1st branching, select according to capacity code of outdoor unit.

\*4 Max. 6.0 capacity code in total can be connected.

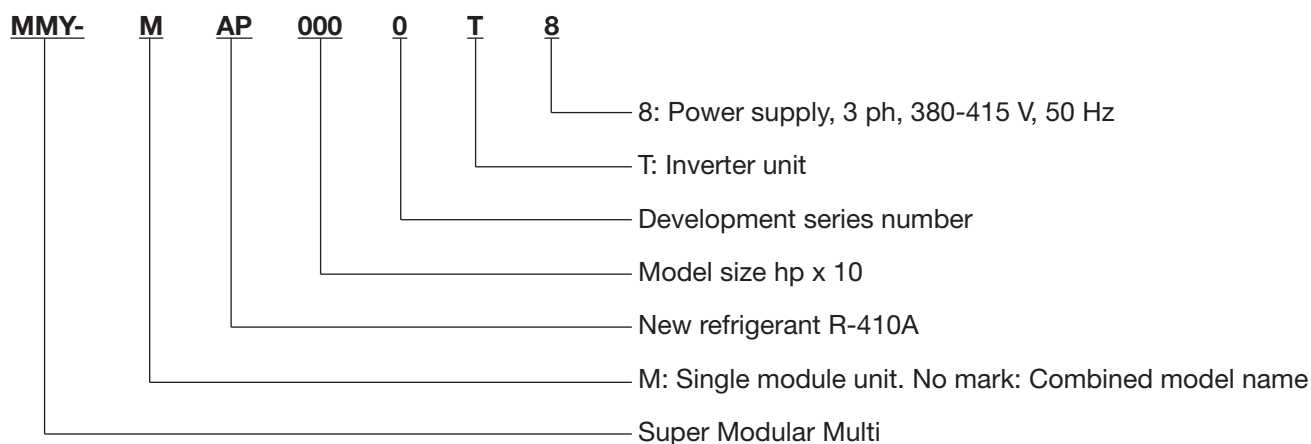

\*5 If capacity code of outdoor unit is 26 and more, it is not used for 1st branching.

\*6 Model names for outdoor and indoor units described in this guide are shortened because of the space constraints.

# 48 hp system

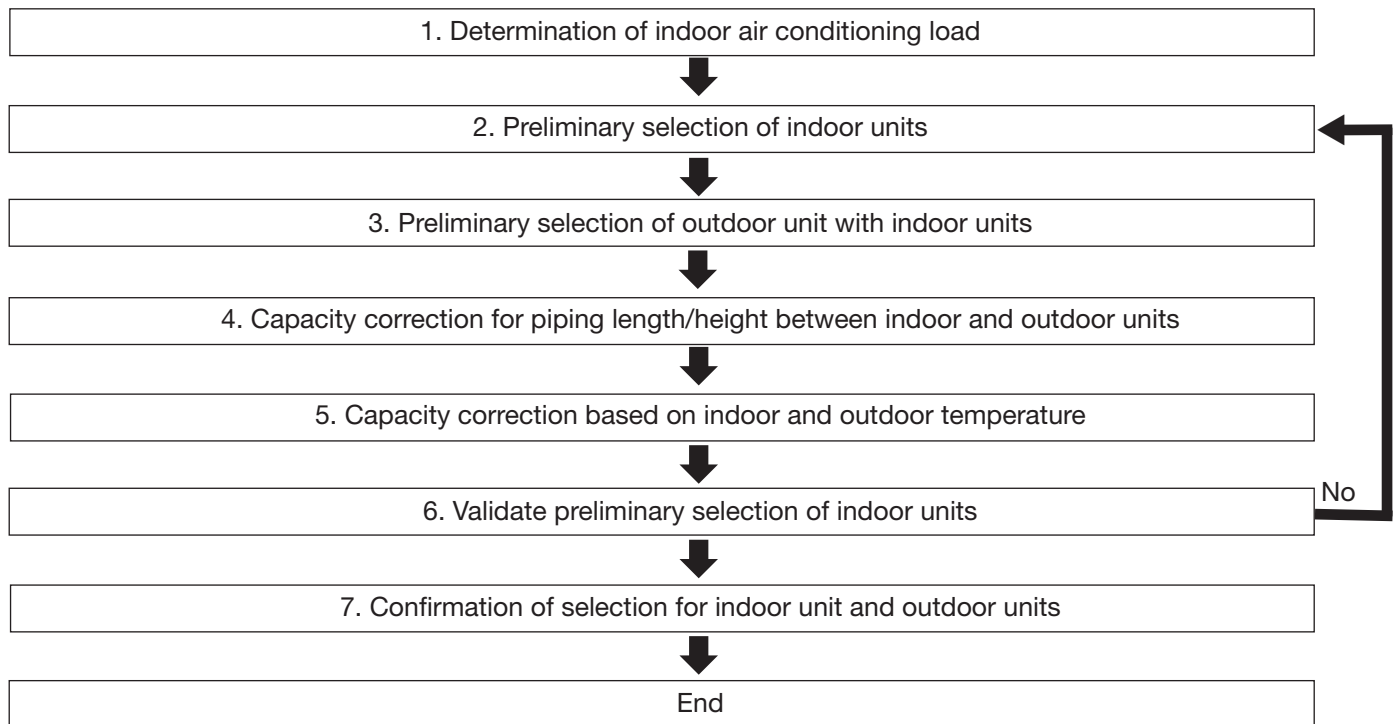

- Max. number of indoor units: 48 units
- Indoor unit capacity code: Min. 24  
Max. 64.8

Capacity code - total 61.9  
Total number of units - 40

## 4. Equipment selection procedure

### 1. Selection flow chart

### 2. Indoor unit and outdoor unit combination

For indoor unit, the capacity code is decided for each model size.

Model size	007	009	012	015	018	024	027	030	036	048	056	072	096
Cooling capacity, kW	2.2	2.8	3.6	4.5	5.6	7.1	8.0	9.0	11.2	14.0	16.0	22.4	28.0
Capacity code	0.8	1	1.25	1.7	2	2.5	3	3.2	4	5	6	8	10

**Note:** Model size: corresponding to Btu/h. Capacity code: corresponding to horsepower.

For outdoor unit, maximum number of connectable indoor units and total capacity code of indoor units are decided.

Outdoor unit (cooling only)	Outdoor unit (heat pump)	Capacity code of outdoor unit	Max. No. of indoor units	Total indoor unit capacity code
MMY-MAP0501T8	MMY-MAP0501HT8	5	8	2.5 to 6.75
MMY-MAP0601T8	MMY-MAP0601HT8	6	10	3 to 8.1
MMY-MAP0801T8	MMY-MAP0801HT8	8	13	4 to 10.8
MMY-MAP1001T8	MMY-MAP1001HT8	10	16	5 to 13.5
MMY-MAP1201T8	MMY-MAP1201HT8	12	20	6 to 16.2
MMY-AP1401T8	MMY-AP1401HT8	14	23	7 to 18.9
MMY-AP1601T8	MMY-AP1601HT8	16	27	8 to 21.6
MMY-AP1801T8	MMY-AP1801HT8	18	30	9 to 24.3
MMY-AP2001T8	MMY-AP2001HT8	20	33	10 to 27.0
MMY-AP2201T8	MMY-AP2201HT8	22	37	11 to 29.7
MMY-AP2211T8	MMY-AP2211HT8	22	37	11 to 29.7
MMY-AP2401T8	MMY-AP2401HT8	24	40	12 to 32.4
MMY-AP2411T8	MMY-AP2411HT8	24	40	12 to 32.4
MMY-AP2601T8	MMY-AP2601HT8	26	43	13 to 35.1
MMY-AP2801T8	MMY-AP2801HT8	28	47	14 to 37.8
MMY-AP3001T8	MMY-AP3001HT8	30	48	15 to 40.5
MMY-AP3201T8	MMY-AP3201HT8	32	48	16 to 43.2
MMY-AP3211T8	MMY-AP3211HT8	32	48	16 to 43.2
MMY-AP3401T8	MMY-AP3401HT8	34	48	17 to 45.9
MMY-AP3411T8	MMY-AP3411HT8	34	48	17 to 45.9
MMY-AP3601T8	MMY-AP3601HT8	36	48	18 to 48.6
MMY-AP3611T8	MMY-AP3611HT8	36	48	18 to 48.6
MMY-AP3801T8	MMY-AP3801HT8	38	48	19 to 51.3
MMY-AP4001T8	MMY-AP4001HT8	40	48	20 to 54.0
MMY-AP4201T8	MMY-AP4201HT8	42	48	21 to 56.7
MMY-AP4401T8	MMY-AP4401HT8	44	48	22 to 59.4
MMY-AP4601T8	MMY-AP4601HT8	46	48	23 to 62.1
MMY-AP4801T8	MMY-AP4801HT8	48	48	24 to 64.8

50 to 135% of outdoor unit capacity

### 3. Cooling/heating capacity characteristics

#### Cooling capacity calculation method:

**Required cooling capacity = cooling capacity x factor (①, ②, ③, ④, ⑤\*1) kW**

① Indoor air wet bulb temperature vs. capacity correction value

② Outdoor air dry bulb temperature vs. capacity correction value

③ Air flow variation ratio of indoor unit vs. capacity correction (for ducted units only)

\*1 Outdoor unit capacity correction factor when total capacity of the indoor units is not equal to the outdoor unit capacity.

④ Connecting pipe length and lift difference between indoor and outdoor units vs. capacity correction value

⑤ Correction of outdoor unit diversity

## Heating capacity calculation method:

**Required heating capacity = heating capacity x factor (①, ②, ③, ④, ⑤\*<sup>1</sup>, ⑥\*<sup>2</sup>) kW**

① Indoor air dry bulb temperature vs. capacity correction value

② Outdoor air wet bulb temperature vs. capacity correction value

③ Air flow variation ratio of indoor unit vs. capacity correction (for ducted units only)

\*<sup>1</sup> Outdoor unit capacity correction factor when total capacity of the indoor units is not equal to the outdoor unit capacity.

\*<sup>2</sup> Refer to the capacity correction for frosting on the outdoor heat exchanger section on page 24.

④ Connecting pipe length and lift difference between indoor and outdoor units vs. capacity correction value

⑤ Correction of outdoor unit diversity

# Capacity correction for frosting on the outdoor heat exchanger (heating mode)

Correct the heating capacity when frost was found on the outdoor heat exchanger.

Heating capacity = Capacity after correction of outdoor unit × correction value of capacity resulting from frost  
 (Capacity after correction of outdoor unit: Heating capacity calculated in the previous section.)

## ⑥ Capacity correction for frosting on the outdoor heat exchanger

# Capacity calculation for each indoor unit

Capacity for each indoor unit =

$$\text{Capacity after correction of outdoor unit} \times \frac{\text{Required standard capacity of indoor unit}}{\text{Total value of standard indoor unit capacity}}$$

# Operating temperature range

# Rated conditions

Cooling: Indoor air temperature 27°C db/19°C wb.  
 Outdoor air temperature 35°C db.  
 Heating: Indoor air temperature 20°C db.  
 Outdoor air temperature 7°C db/6°C wb.

The unit can be operated even if outdoor temperature falls to -20°C. However, the warranty only covers operation down to -15°C, as lower temperatures are outside the operating range.

When the outdoor air temperature falls to below -15°C, unit operation may reduce the product life.

# Example of equipment selection

The following shows an example of equipment selection based upon a building model.

**Fig. 1 - Overview of building model**

- Steel frame, reinforced concrete building, four floors above ground. Total floor area : 415 m<sup>2</sup>  
Outdoor unit is installed on the roof.
- Indoor design conditions:  
Cooling: 27.0/19.0°C db/wb. Heating: 20°C db
- Outdoor design conditions:  
Cooling: 35°C db (standard condition). Heating: 3°C wb (standard condition: 6°C wb)

## Selection criteria for each floor

### 1F: Outdoor unit capacity exactly matches the total indoor unit capacity.

Total indoor unit hp = Outdoor unit hp      Indoor: 2.5 hp x 2 units + 3.2 hp + 2 hp = 10.2 hp  
Outdoor: 10 hp    Same capacity

### 2F: Outdoor unit capacity matches the potential total indoor unit capacity with the possibility of future extension.

Office rooms 2 and 3 are to be used as warehouses at first, so air conditioning is not necessary at present. However, there is a plan to convert them into offices, so an outdoor module with extra capacity is required. Piping/wiring are carried out. Indoor unit is not yet installed. When the rooms are used as an office later, the indoor unit is installed.

### 3F: One indoor unit is connected to one outdoor unit.

The outdoor module should have sufficient capacity to cover the peak demand of the indoor unit connected.

### 4F: Consider the diversity factor and have the outdoor module match 135% of indoor unit capacity.

This is a typical matching of indoor/outdoor units for a Super MMS system.

- Total indoor unit hp > Outdoor unit hp
- Select each indoor unit based on individual peak room load.  
Indoor: 2.5 hp + 2.5 hp + 2 hp + 2 hp (capacity difference in each room) + 1.3 hp = 10.3 hp (different capacity)      ←—————→      Outdoor: 8 hp (different capacity)
- The cooling load profile needs to be taken into consideration.

## Procedure and result of equipment selection

### 1. Procedure of equipment selection

- Calculate cooling for every room.
- Select an indoor unit to match the cooling load for every room from the table on page 10.
- Select the outdoor module to match the indoor units selected in point b. Select the outdoor modules based on the critical factors and the combination rule. Choose a tentative outdoor module that will match the indoor units, and check whether the selection agrees with the combination rule. Perform the capacity correction based on the pipe length, system lift, indoor set temperature, outdoor temperature. Then, make sure the corrected system cooling capacity satisfies the cooling load.

### 2. Equipment selection and capacity check

Air conditioning load				Equipment selection					
Floor	Room No.	Indoor air conditioning load (kW)		Indoor unit			Outdoor unit		
		Cooling	Heating	Model MMU-	Capacity (kW)		Model MMY	Capacity (kW)	
					Cooling	Heating		Cooling	Heating
4F	4-1	6.0 (16 o'clock)	5.4	AP0241H	7.1	8.0	AP2801HT8	78.5	88.0
	4-2	5.2 (14 o'clock)	4.2	AP0181H	5.6	6.3			
	4-3	5.0 (14 o'clock)	4.2	AP0181H	5.6	6.3			
	4-4	3.2 (12 o'clock)	2.7	AP0121H	3.6	4.0			
	4-5	6.4 (10 o'clock)	5.4	AP0241H	7.1	8.0			
3F	3-1	12.7	12.0	AP0481H	14.0	16.0			
2F	2-1	4.8	4.5	AP0181H	5.6	6.3			
	2-2	4.6	4.8	AP0181H	5.6	6.3			
	2-3	—	—	—	—	—			
1F	1-1	6.5	6.0	AP0241H	7.1	8.0			
	1-2	6.5	6.3	AP0241H	7.1	8.0			
	1-3	7.2	7.0	AP0301H	9.0	10.0			
	1-4	5.1	4.5	AP0181H	5.6	6.3			

Note: ( ): Peak occurrence time

Piping distance				Capacity correction		Capacity check after correction		Result
Floor	Room No.	Equivalent length (m)	Height difference (m)	Pipe correction x temp. correction		Capacity (kW)		
				Cooling	Heating	Cooling	Heating	
4F	4-1	43	12	0.920	0.957	6.5	6.9	Good
	4-2			x	x	5.2	5.4	
	4-3			1.0	1.0	5.2	5.4	
	4-4			x	x	3.3	3.5	
	4-5			1.0	0.95	6.5	6.9	
3F	3-1	=	x	12.9	13.8			
2F	2-1	0.920	0.95	5.2	5.4			
	2-2	=	=	5.2	5.4			
	2-3	—	0.864	—	—			
1F	1-1	—	—	6.5	6.9			
	1-2	—	—	6.5	6.9			
	1-3	—	—	8.3	8.6			
	1-4	—	—	5.2	5.4			

### Example: Equipment selection based on system load profile

Since the five rooms on the 4th floor face different directions, their hourly cooling load profile will also be different. We select each indoor unit based on the individual room peak load. However, we need to use the total load profile on the 4th floor as a base to choose the outdoor module.

Load in each room

Total load in all rooms of 4th floor

4-1

4-2

4-3

4-4

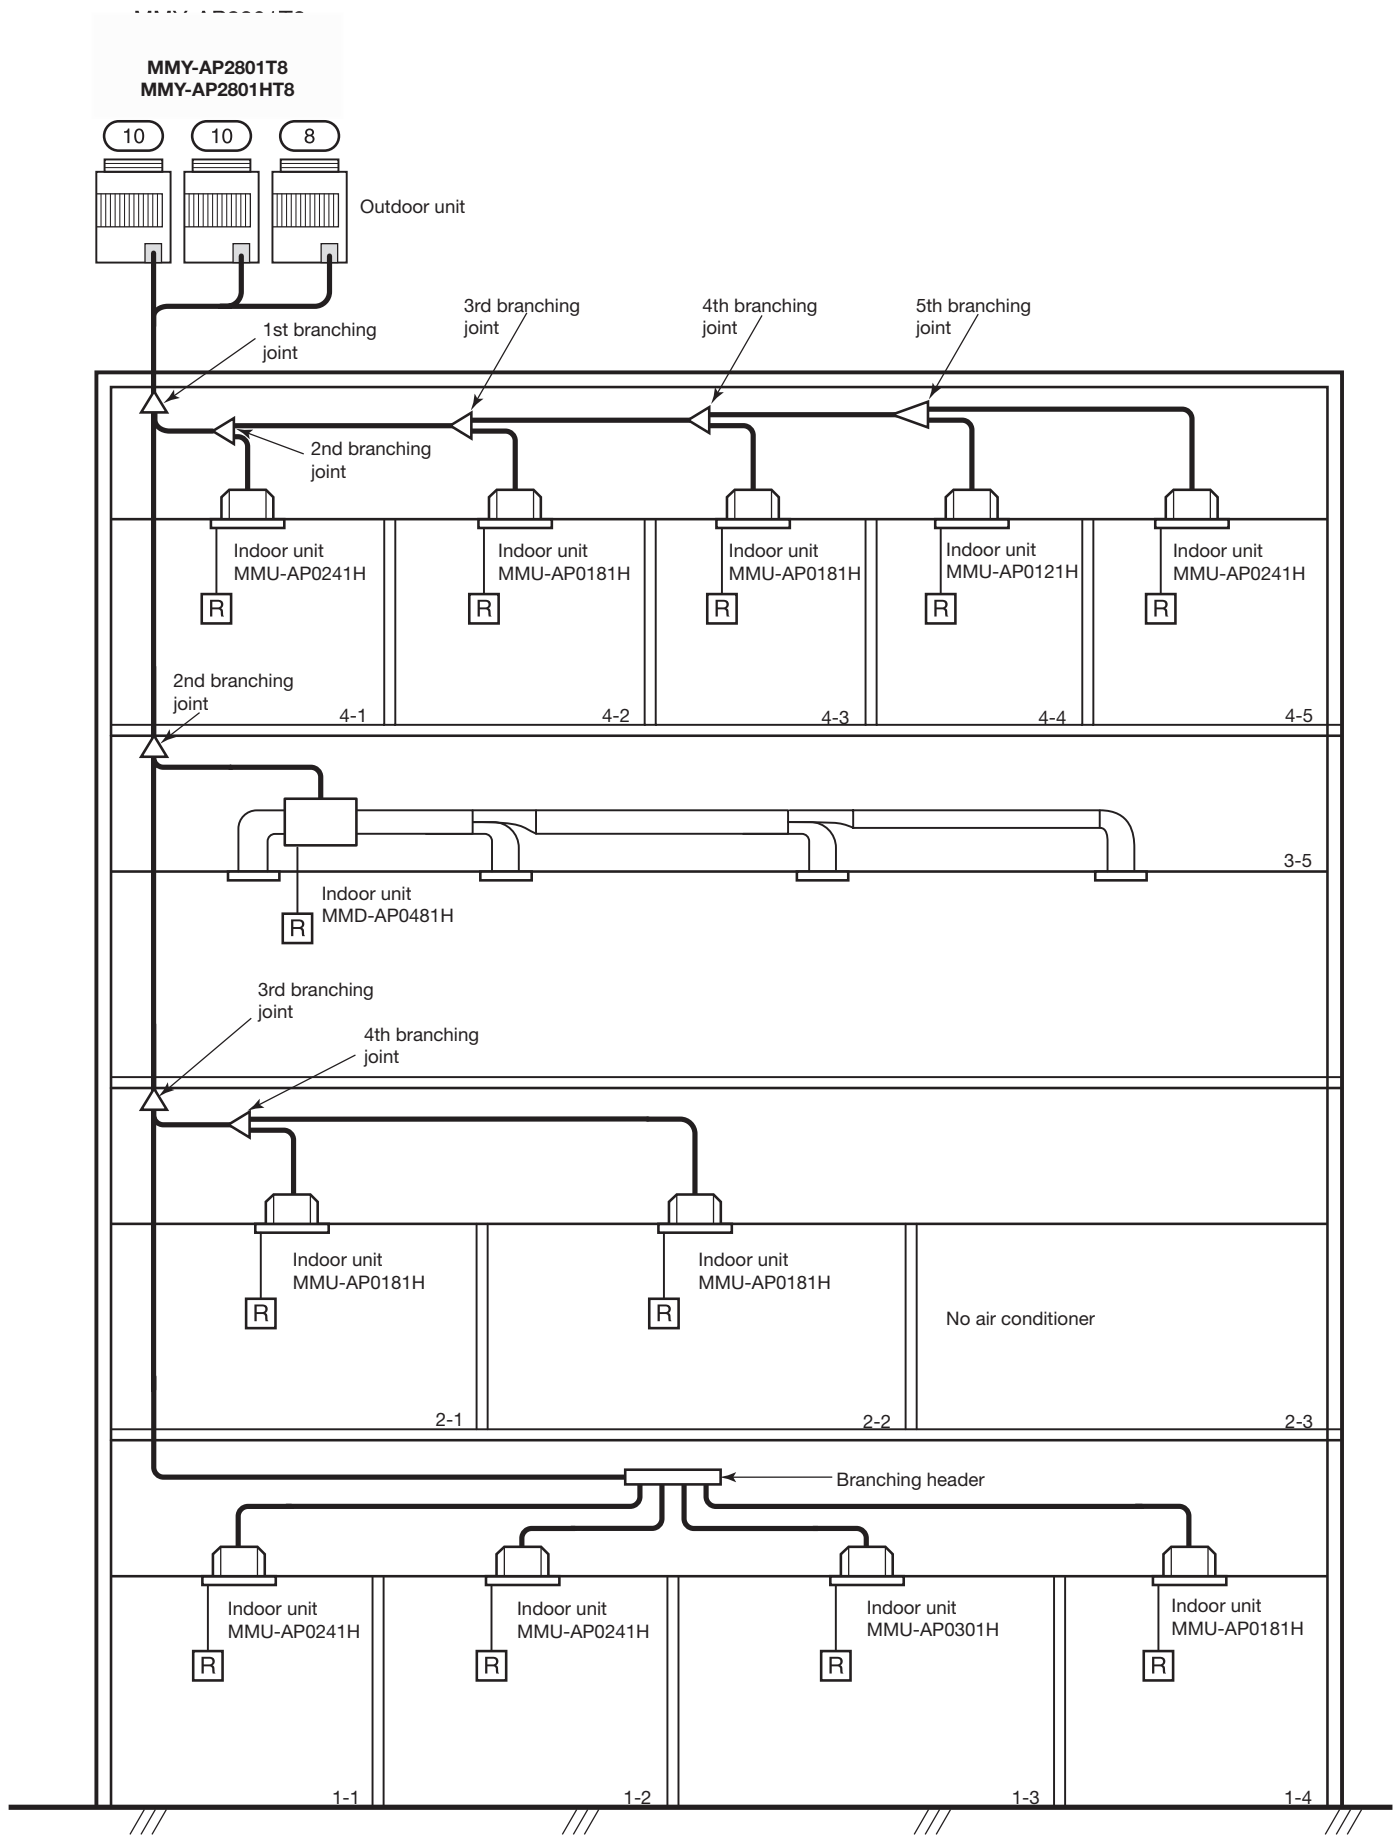

4-5

1. The total load on the 4th floor is calculated by adding up the hourly cooling loads of the five rooms.
2. The maximum value of the total load is used to select the outdoor module.

# Schematic diagram

## 5. Refrigerant piping design

### 1. Warnings on refrigerant leakage

#### Check of concentration limit

The room in which the air conditioner is to be installed requires a design that ensures that the concentration of refrigerant gas will not exceed a set limit if there is a leak.

Refrigerant R-410A which is used in the air conditioner is safe, without the toxicity or combustibility of ammonia, and is not restricted by laws that protect the ozone layer. However, since it contains more than air, it poses the risk of suffocation if its concentration should rise excessively. Suffocation from leakage of R-410A is almost non-existent. With the recent increase in the number of high concentration buildings, however, the installation of multi air conditioner systems is on the increase because of the need for effective use of floor space, individual control, energy conservation by curtailing heat and carrying power, etc.

Most importantly, the multi air conditioner system is able to contain a large amount of refrigerant compared with conventional individual air conditioners. If a single unit of the multi air conditioner system is to be installed in a small room, select a suitable model and installation procedure so that if the refrigerant accidentally leaks out, its concentration does not reach the limit (and in the event of an emergency, measures can be made before injury can occur).

In a room where the concentration may exceed the limit, create an opening to adjacent rooms, or install mechanical ventilation combined with a gas leak detection device. The concentration is as given below.

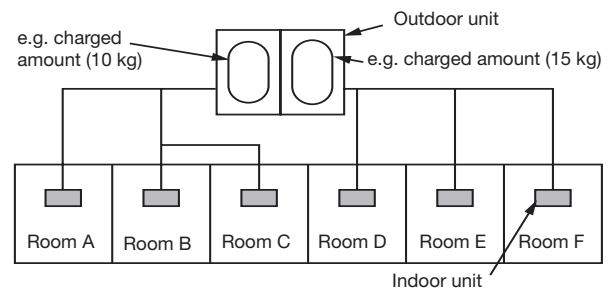

$$\frac{\text{Total amount of refrigerant (kg)}}{\text{Min. volume of the indoor unit installed room (m}^3\text{)}} \leq \text{Concentration limit (kg/m}^3\text{)}$$

The concentration limit of R-410A which is used in multi air conditioners is 0.3 kg/m<sup>3</sup>.

**Note 1:** If there are 2 or more refrigeration systems in a single refrigeration device, the amounts of refrigerant should be as charged in each independent device.

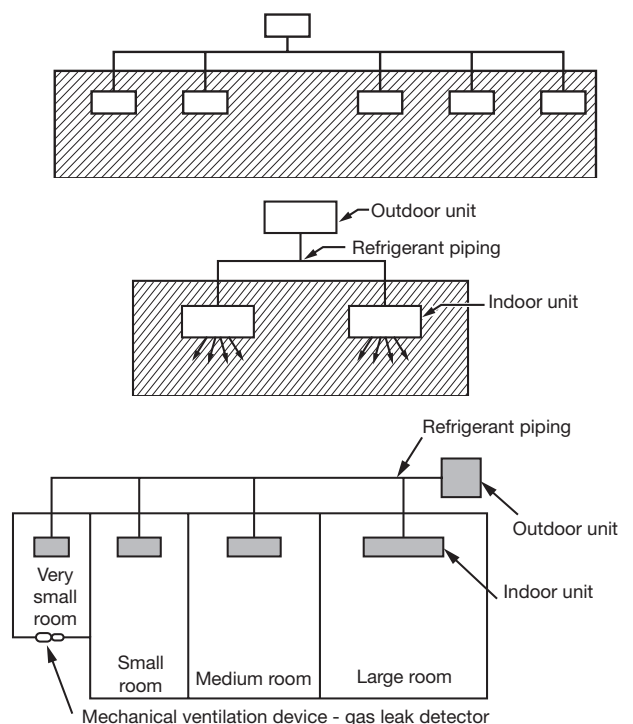

For the amount of charge in this example:

- The possible amount of leaked refrigerant gas in rooms A, B and C is 10 kg.
- The possible amount of leaked refrigerant gas in rooms D, E and F is 15 kg.

**Note 2:** The standards for minimum room volume are as follows:

- (1) No partition (shaded portion)
- (2) When there is an effective opening with the adjacent room for ventilation of leaking refrigerant gas (opening without a door, or an opening 0.15% or larger than the respective floor spaces at the top or bottom of the door).
- (3) If an indoor unit is installed in each partitioned room and the refrigerant piping is interconnected, the smallest room is the critical room. But when a mechanical ventilation device is installed in combination with a gas leak detector in the smallest room where the density limit is exceeded, the volume of the next smallest room is used.

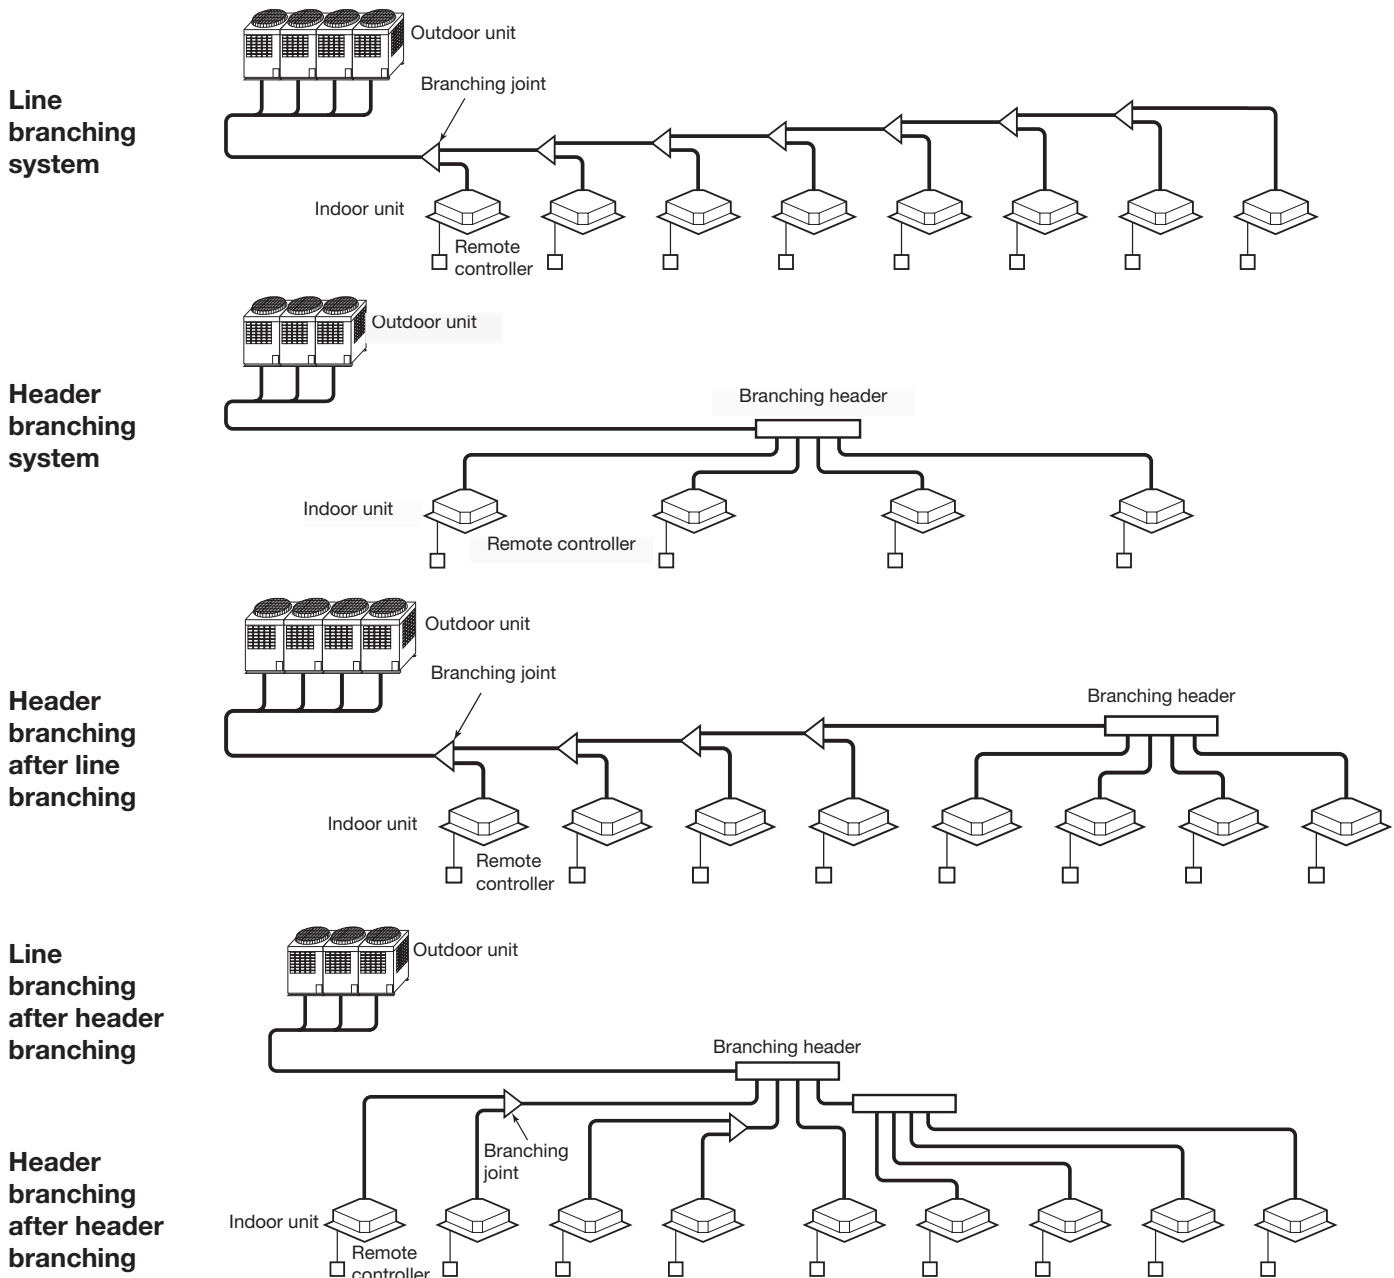

**Note 3:** The minimum indoor floor area compared with the amount of refrigerant is roughly as follows (when the ceiling is 2.7 m high):

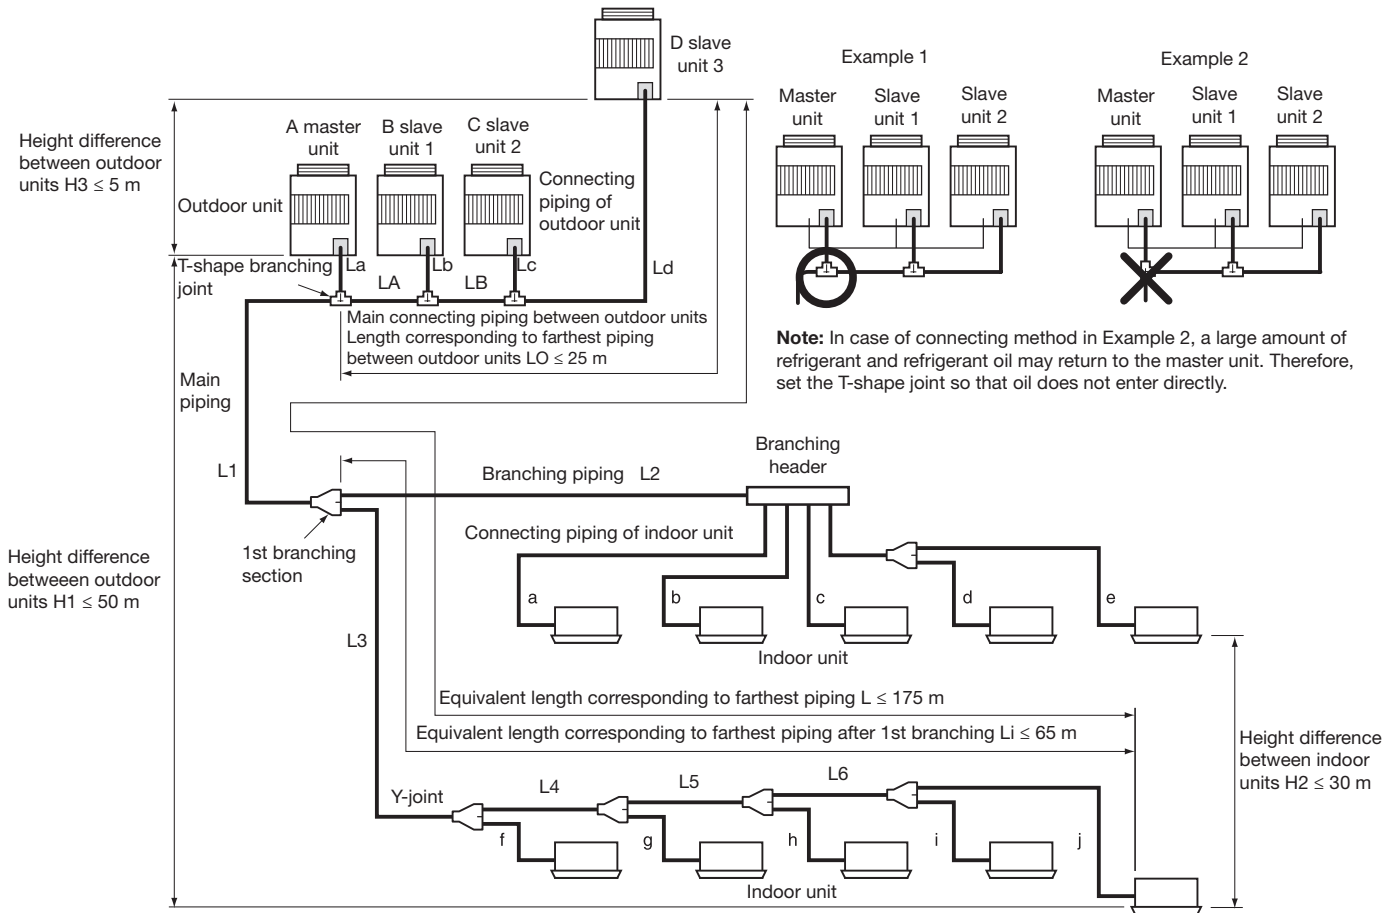

## 2. Free branching system

- ① Line branching system
- ② Header branching system
- ③ Header branching after line branching
- ④ Line branching after header branching
- ⑤ Header branching after header branching

The above five branching systems are available to increase significantly the flexibility of refrigerant piping design.

### 3. Allowable length/height difference of refrigerant piping

**Note:** In case of connecting method in Example 2, a large amount of refrigerant and refrigerant oil may return to the master unit. Therefore, set the T-shape joint so that oil does not enter directly.

#### System restrictions

Max. No. of combined outdoor units	4 units	
Max. capacity of combined outdoor units	48 hp	
Max. No. of connected indoor units	48 units	
Max. capacity of combined indoor units	$H_2 \leq 15$	135%
	$H_2 > 15$	105%

- Note 1:** Combination of outdoor units: Master unit (1 unit) + slave units (0 to 3 units). Master unit is the outdoor unit nearest to the connected indoor units.
- Note 2:** Install the outdoor units in order of capacity. (Master unit  $\geq$  slave unit 1  $\geq$  slave unit 2  $\geq$  slave unit 3) Refer to outdoor unit combination table on page 7.
- Note 3:** Refer to outdoor unit combination table on page 7.
- Note 4:** Piping to indoor units shall be perpendicular to piping to the master outdoor unit as in Example 1. Do not connect piping to indoor units in the same direction as the master outdoor unit in Example 2.

#### Allowable length and height difference of refrigerant piping

		Allowable value	Piping section	
Piping length	Total extension of pipe (liquid pipe, actual length)	300 m	$LA + LB + La + Lb + Lc + Ld + L1 + L2 + L3 + L4 + L5 + L6 + L7 + a + b + c + d + e + f + g + h + i + j$	
	Farthest piping length L (*)	Actual length	150 m	$LA + LB + Ld + L1 + L3 + L4 + L5 + L6 + j$
		Equivalent length	175 m	
	Equivalent length of farthest piping from 1st branching $L_i$ (*)	65 m		$L3 + L4 + L5 + L6 + j$
	Equivalent length of farthest piping between outdoor units $L_O$ (*)	25 m		$LA + LB + Ld, (LA + Lb, LA + LB + Lc)$
	Max. equivalent length of main piping (**)	85 m		L1
	Max. equivalent length of outdoor unit connection piping	10 m		$Ld, (La, Lb, Lc)$
Height difference	Max. actual length of indoor unit connection piping	30 m	a, b, c, d, e, f, g, h, i, j	
	Height between indoor and outdoor units H1	Upper outdoor unit	50 m	--
		Lower outdoor unit	40 m (**)	--
	Height between indoor units H2		30 m	--
	Height between outdoor units H3		5 m	--

\* (D) is outdoor unit farthest from 1st branching, and (j) is indoor unit farthest from 1st branching.

\*\* If the height difference (H2) between indoor units exceeds 3 m, set below 30 m.

\*\*\* If the maximum combination capacity of the outdoor units is 46 hp or more, the maximum equivalent length is restricted up to 70 m.

## 4. Selection of refrigerant piping

### ① Pipe size of outdoor unit (Table 1)

Model name	MMY-	Gas side	Liquid side
MAP0501T8	MAP0501HT8	Ø5/8"	Ø3/8"
MAP0601T8	MAP0601HT8	Ø3/4"	Ø3/8"
MAP0801T8	MAP0801HT8	Ø7/8"	Ø1/2"
MAP1001T8	MAP1001HT8	Ø7/8"	Ø1/2"
MAP1201T8	MAP1201HT8	Ø1-1/8"	Ø1/2"

### ② Connecting pipe size between outdoor units (Table 2)

Total capacity code of outdoor units downstream	Gas side	Liquid side	Balance pipe
14 to below 22	Ø1-1/8"	Ø5/8"	Ø3/8"
22 to below 26	Ø1-3/8"	Ø5/8"	Ø3/8"
26 to below 36	Ø1-3/8"	Ø3/4"	Ø3/8"
36 or more	Ø1-5/8"	Ø7/8"	Ø3/8"

### ③ Size of main pipe (Table 3)

Total capacity code of all outdoor units (*1)	Gas side	Liquid side
Below 6	Ø5/8"	Ø3/8"
6 to below 8	Ø3/4"	Ø3/8"
8 to below 12	Ø7/8"	Ø1/2"
12 to below 14	Ø1-1/8"	Ø1/2"
14 to below 22	Ø1-1/8"	Ø5/8"
22 to below 26	Ø1-3/8"	Ø5/8"
26 to below 36	Ø1-3/8"	Ø3/4"
36 to below 46	Ø1-5/8"	Ø7/8"
46 or more	Ø1-5/8" (*5)	Ø7/8"

Determine thickness of the main pipe according to capacity of the outdoor units.

### ④ Pipe size between branching sections (Table 4)

Total capacity code of indoor units downstream (*1)	Gas side	Liquid side
2.8 or less	Ø1/2"	Ø3/8"
2.8 to below 6.4	Ø5/8"	Ø3/8"
6.4 to below 12.2	Ø7/8"	Ø1/2"
12.2 to below 20.2	Ø1-1/8"	Ø5/8"
20.2 to below 25.2	Ø1-3/8"	Ø5/8"
25.2 to below 35.2	Ø1-3/8"	Ø3/4"
35.2 or more	Ø1-5/8"	Ø7/8"

If the total capacity code value of indoor units exceeds that of the outdoor units, apply the capacity code of the outdoor units.

\*1 Code is determined according to the unit size. For details, refer to pages 7-9.

\*2 When using Y-shape branching joint for 1st branching, select according to capacity code of outdoor unit.

\*3 For one line after header branching, indoor units with a maximum of 6.0 capacity code in total can be connected.

\*4 If the pipe size is Ø3/4" or more, use a hard type or half hard type for material of the pipe.

\*5 The maximum equivalent length of the main pipe should be 70 m or shorter.

### ⑤ Piping of indoor unit (Table 5)

Indoor unit size	Gas side	Liquid side
007 to 012	Actual length 15 m or less Ø3/8"	Ø1/4"
	Actual length exceeds 15 m Ø1/2"	Ø1/4"
015 to 018	Ø1/2"	Ø1/4"
024 to 056	Ø5/8"	Ø3/8"
072 to 096	Ø7/8"	Ø1/2"

### ⑥ Selection of branching section (Table 6)

	Total capacity code of indoor unit (*1)	Model
Y-shape branching joint (*2)	Below 6.4	RBM-BY53E
	6.4 to below 14.2	RBM-BY103E
	14.2 to below 25.2 25.2 or more	RBM-BY203E RBM-BY303E
Branching header (*3)	For 4 branching	Below 14.2 14.2 to below 25.2
	For 8 branching	Below 14.2 14.2 to below 25.2
T-shape branching joint (For connecting outdoor unit)	1 set of 3 types of T-shape joint pipes as described below: The required quantity is arranged and combined at the site.	RBM-BT13E
	<ul style="list-style-type: none"> <li>Balance pipe (Corresponding difference Ø3/8" × 1)</li> <li>Piping at liquid side (Corresponding difference Ø3/8" to Ø7/8" × 1)</li> <li>Piping at gas side (Corresponding difference Ø5/8" to Ø1-5/8" × 1)</li> </ul>	

### ⑦ Minimum wall thickness for R-410A application (Table 7)

Soft	Half hard or hard	OD (Inch)	Minimum wall thickness (mm)
OK	OK	1/4"	0.80
OK	OK	3/8"	0.80
OK	OK	1/2"	0.80
OK	OK	5/8"	1.00
NG	OK (*4)	3/4"	1.00
NG	OK (*4)	7/8"	1.00
NG	OK (*4)	1-1/8"	1.00
NG	OK (*4)	1-3/8"	1.10
NG	OK (*4)	1-5/8"	1.25

## 5. Charging requirement with additional refrigerant

After the system has been evacuated, replace the vacuum pump with a refrigerant cylinder and charge the system with additional refrigerant.

### Calculating the amount of additional refrigerant required

Refrigerant in the system when shipped from the factory

		5 hp	6 hp	8 hp	10 hp	12 hp
Factory refrigerant charge	Heat pump	8.5 kg	8.5 kg	12.5 kg	12.5 kg	12.5 kg
	Cooling only	8.0 kg	8.0 kg	11.0 kg	11.0 kg	11.0 kg

When the system is charged with refrigerant at the factory, the amount of refrigerant needed for the pipes at the site is not included. Calculate the additional amount needed, and add that amount to the system.

#### Calculation

Additional refrigerant charge amount is calculated from the size of the liquid pipe at the site and its actual length.

Additional refrigerant charge amount at the site =

Actual length of liquid pipe × Additional refrigerant charge amount + Compensation by system hp (Table 2) per 1 m liquid pipe (Table 1)

Example: Additional charge amount R (kg) = (L1 × 0.025 kg/m) + (L2 × 0.055 kg/m) + (L3 × 0.105 kg/m) + (3.0 kg)  
 L1: Actual total length of liquid pipe Ø1/4" (m)  
 L2: Actual total length of liquid pipe Ø3/8" (m)  
 L3: Actual total length of liquid pipe Ø1/2" (m)

Table 7-1

Liquid side pipe diameter	Ø1/4"	Ø3/8"	Ø1/2"	Ø5/8"	Ø3/4"	Ø7/8"
Additional refrigerant amount/1 m	0.025 kg	0.055 kg	0.105 kg	0.160 kg	0.250 kg	0.350 kg

Table 7-2

Combined horse power (hp)	Outdoor unit combination (hp)			Compensation by system hp (kg)	
5	5			0.0	
6	6			0.0	
8	8			1.5	
10	10			2.5	
12	12			3.5	
14	8	6		0.0	
16	8	8		0.0	
18	10	8		0.0	
20	10	10		3.0	
22	12	10		5.0	
24	8	8	6	0.0	
	12	12		7.0	
26	8	8	8	-4.0	
	10	8	8	-4.0	
28	10	10	8	-2.0	
30	10	10	10	0.0	
32	12	10	10	1.0	
	8	8	8	8	-6.0
34	12	12	10		3.0
	10	8	8	8	-6.0
36	12	12	12		4.0
38	10	10	8	8	-6.0
	10	10	10	10	-5.0
40	10	10	10	10	-5.0
42	12	10	10	10	-4.0
44	12	12	10	10	-2.0
46	12	12	12	10	0.0
48	12	12	12	12	2.0

## 6. Wiring design

### 1. General

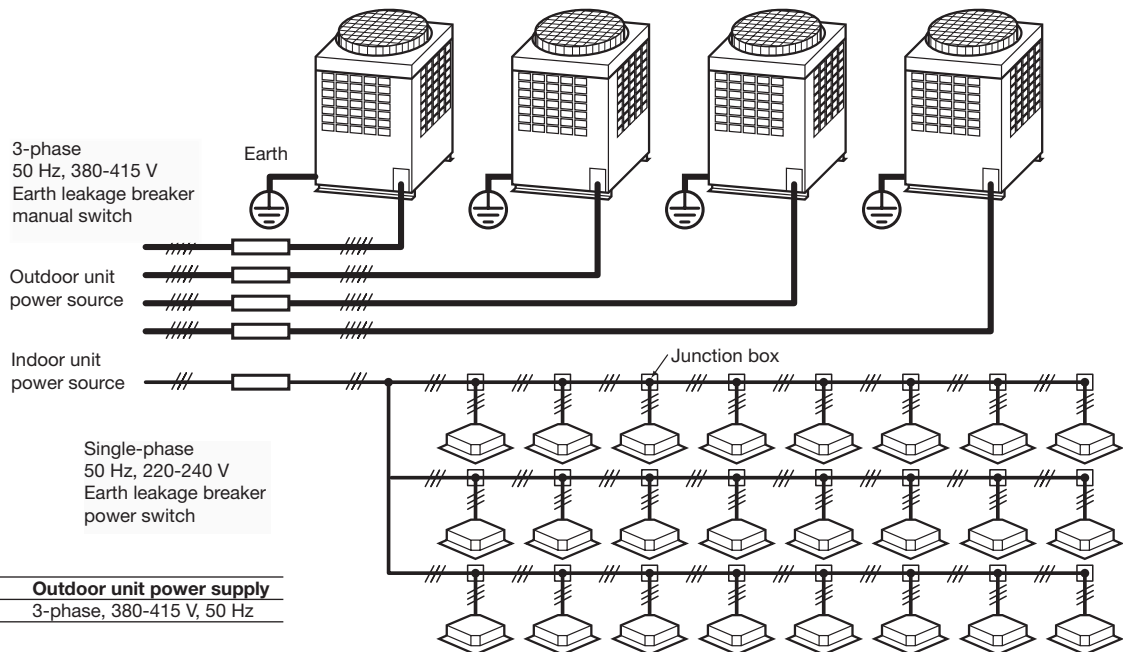

- (1) Perform wiring of the power supply in conformance with the regulations of the local electric company.
- (2) For the control wires connecting indoor units, outdoor units, and between indoor and outdoor units, use of double-core shielded wires is recommended to prevent noise disturbance.
- (3) Be sure to set the earth leakage breaker and the switches to the power supply section of the indoor unit.
- (4) Supply power to each outdoor unit and provide an earth leakage breaker or hand switch for each outdoor unit.
- (5) Never connect the 220–240 V power to the terminal block (U1, U2, U3, U4, U5, U6) for control cables, as this will cause problems.
- (6) The control wiring system and refrigerant piping system should be in the same line.
- (7) Arrange the cables so that the power cables do not come into contact with the high-temperature part of the pipe; otherwise the coating may melt and cause an accident.
- (8) Do not turn on the power to the indoor unit until the refrigerant pipes have been completely evacuated.

### 2. Outdoor unit power supply

- Select the power supply cabling and fuse of each outdoor unit from the following specifications: 5-core cable, in accordance with 60245 IEC 66.
- Connect the outdoor units via the incorporated terminal block (L1, L2, L3, N).

### 3. Electrical wiring design

Model	Outdoor unit power supply
MMY-AP***T8, HT8	3-phase, 380-415 V, 50 Hz

#### Unit capacities and power supply wire sizes (reference)

Model	Power supply wiring	Field-supplied fuse
MMY-	Wire size	
MAP0501T8	MAP0501HT8 3.5 mm <sup>2</sup> (AWG #12) Max. 26 m	20 A
MAP0601T8	MAP0601HT8 3.5 mm <sup>2</sup> (AWG #12) Max. 26 m	20 A
MAP0801T8	MAP0801HT8 3.5 mm <sup>2</sup> (AWG #10) Max. 20 m	30 A
MAP1001T8	MAP1001HT8 5.5 mm <sup>2</sup> (AWG #10) Max. 28 m	30 A
MAP1201T8	MAP1201HT8 5.5 mm <sup>2</sup> (AWG #10) Max. 27 m	30 A

- Determine the wire size for the indoor unit according to the number of connected indoor units downstream.
- Observe local regulations regarding wire size selection and installation.

## 4. Indoor unit power supply (must be independent from outdoor unit power)

Model	Power supply wiring		Field-supplied fuse	
	Wire size			
All models of indoor units	2.0 mm <sup>2</sup> (AWG #14)	Max. 20 m	3.5 mm <sup>2</sup> (AWG #12)	Max. 50 m
				15 A

**Note:** The connecting length indicated in the table represents the length from the junction box to the outdoor unit when the indoor units are connected in parallel for power, as shown in the illustration on the previous page. A voltage drop of no more than 2% is assumed. If the connecting length exceeds the length indicated in the table, select the wire thickness in accordance with local wiring standards.

### CAUTIONS

- (1) **Keep the refrigerant piping system and the indoor-indoor/indoor-outdoor control wiring systems together.**
- (2) **When running power wires and control wires parallel to each other, either run them through separate conduits, or maintain a suitable distance between them.**  
(Current capacity of power wires: 10 A or less for 300 m, 50 A or less for 500 m)

## 5. Control wiring design

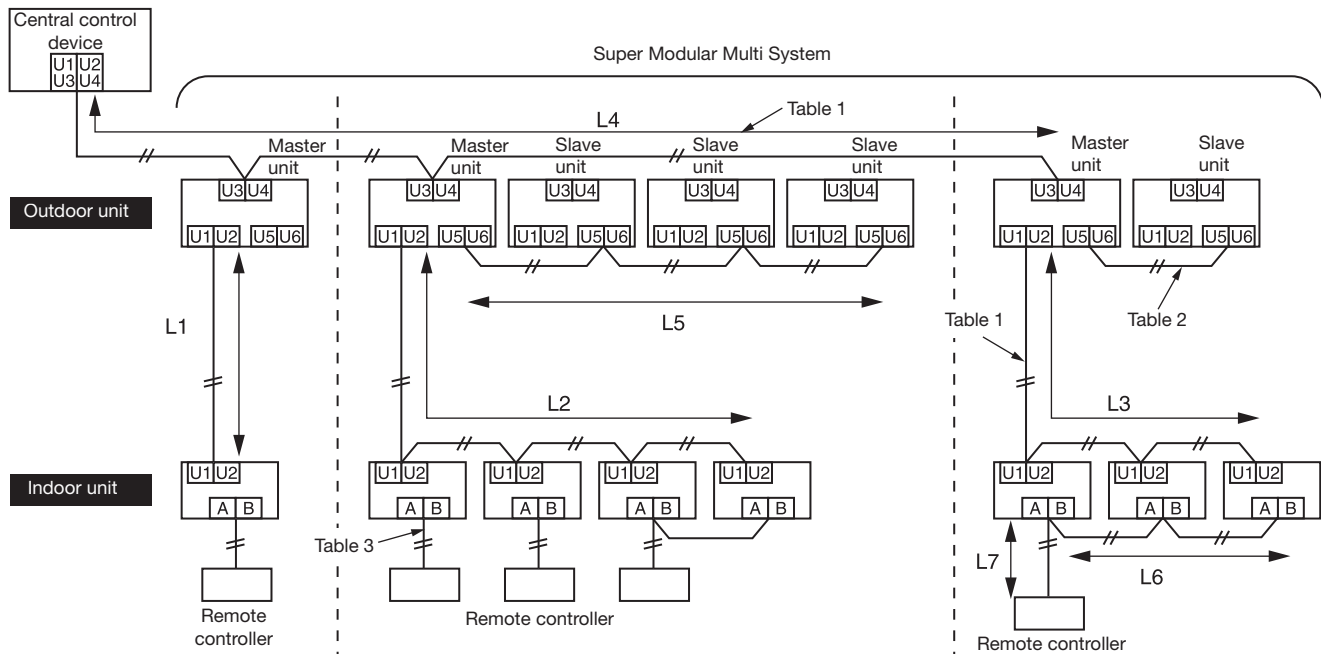

### Wire specification, quantity, size of interconnecting wiring and remote controller wiring

Name	Quantity	Size			Specification
		Up to 500 m	Up to 1000 m	1000 to 2000 m	
Interconnecting wiring (indoor-indoor/indoor-outdoor/outdoor-outdoor control wiring, central control wiring)	2 cores	1.25 mm <sup>2</sup>		2.0 mm <sup>2</sup>	Shielded wire
Remote controller wiring	2 cores	0.5 to 2.0 mm <sup>2</sup>	-	-	-

- (1) The interconnecting wiring and central control wiring use 2-core non-polarity interconnecting wires. Use 2-core shielded wires to prevent noise disturbance. In this case, close (connect) the end of shielded wires, and perform the functional grounding for the end of the shielded wires which are connected to both indoor and outdoor units. For the shielded wires which are connected between the central remote controller and the outdoor unit, perform the functional grounding at only one end of the central control wiring.
- (2) Use 2-core non-polarity wire for remote controller (A, B terminals).  
Use 2-core non-polarity wire for wiring of group control (A, B terminals).

## 6. Control wiring diagram

- All control wiring is 2-core non-polarity wire.
- Be sure to use shielded wire for the following wiring to prevent noise disturbance.
  - Outdoor-outdoor/indoor-indoor/outdoor-indoor control wiring, central control wiring.

**Table 1 Control wiring between indoor and outdoor units (L1, L2, L3)  
Central control wiring (L4)**

<b>Wiring</b>	2-core, non-polarity
<b>Type</b>	Shielded wire
<b>Size</b>	1.25 mm <sup>2</sup> : Up to 1000 m
<b>Length</b>	2.0 mm <sup>2</sup> : Up to 2000 m (*1)

(\*1): Total of control wiring length for all refrigerant circuits (L1 + L2 + L3 + L4)

**Table 2 Control wiring between outdoor units (L5)**

<b>Wiring</b>	2-core, non-polarity
<b>Type</b>	Shielded wire
<b>Size</b>	1.25 mm <sup>2</sup> to 2.0 mm <sup>2</sup>
<b>Length</b>	Up to 100 m (L5)

**Table 3 Remote controller wiring (L6, L7)**

<b>Wire</b>	2-core
<b>Size</b>	0.5 mm <sup>2</sup> to 2.0 mm <sup>2</sup>
<b>Length</b>	<ul style="list-style-type: none"> <li>Up to 500 m (L6 + L7).</li> <li>Up to 400 m in case of wireless remote controller in group control.</li> <li>Up to 200 m total length of control wiring between indoor units (L6).</li> </ul>

## 7. Design

Type	Model	Nominal voltage (V-ph-Hz)	Voltage range		Fan motor		Power supply	
			Min.	Max.	kW	FLA	MCA	MOCP

Legend

- MCA Minimum circuit current, A
- FLA Full load current, A
- MOCP Maximum overcurrent protection current, A
- kW Rated fan motor output, kW
- RLA Rated load current, A

Note: RLA is based on the following conditions:

- Indoor temperature: 27°C db/19°C wb
- Outdoor temperature: 35°C db

## 7. Controls

### A range of controls to meet various system needs

As the size of the building increases so does the number of air conditioning units required. The multiple air conditioning system Super MMS ensures energy savings and comfort by allowing control of multiple units requiring different loads.

The Super MMS provides a range of functions to enable integrated, centralized control of multiple units. Design an optimal system that best suits the application and scale of your project.

#### 1. Control via indoor remote controller

##### 1-1. Remote controller

Individual air conditioning units can be controlled remotely.

##### 1-2. Group control

One remote controller can control a maximum of 8 indoor units in a group.

##### 1-3. Two controlling positions

The units can be controlled from two locations using two remote controllers.

##### 1-4. Weekly timer

The units can be run on a weekly schedule using a "remote controller with weekly timer".

#### 2. Control via the central remote controller

##### 2-1. Central control + individual control

Up to 64 units can be controlled using the central remote controller and/or indoor remote controllers.

##### 2-2. Weekly timer controller

The central remote controller can be connected to a weekly timer to set a weekly running schedule.

##### 2-3. Control without indoor remote controller

The units can be operated from the central remote controller only, without the use of indoor remote controllers.

##### 2-4. Central control with 1 to 1 models

Additionally, 1 to 1 models like the Digital Inverter or Super Digital Inverter can be joined into the Super MMS central control scheme.

#### 3. Network control

The Super MMS control system can offer flexible centralized network control according to various customer requirements, for both open network building control in combination with other building apparatus such as elevator, fire alarm, lighting, etc., and also for stand-alone central air conditioning control.

These central control systems are mainly established by advanced local server platforms.

##### 3-1. Open network control

Super MMS open network control is applicable for major global building management standards.

###### 3-1-1. LONWORKS

The LONWORKS interface manages the Super MMS air conditioning system as a LON device to command a building computer message and to monitor the operating status.

###### 3-1-2. BACnet

The local server serves air conditioning sub-system in a building control BACnet system.

##### 3-2. Stand-alone central control

Simple exclusive air conditioning central control with less system integration work.

###### 3-2-1. Touch-screen controller

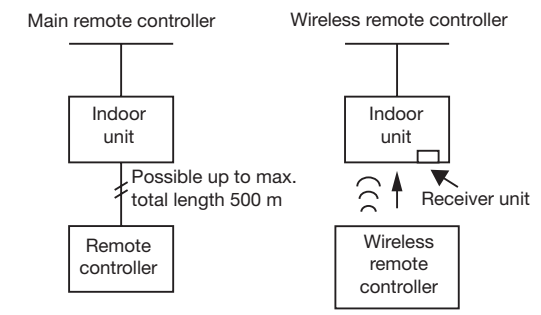

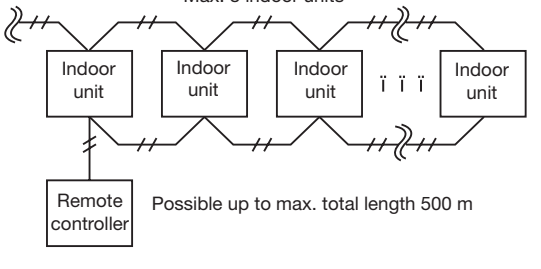

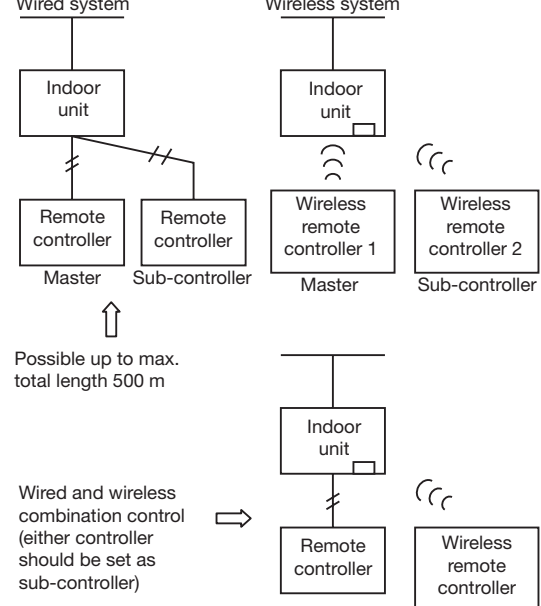

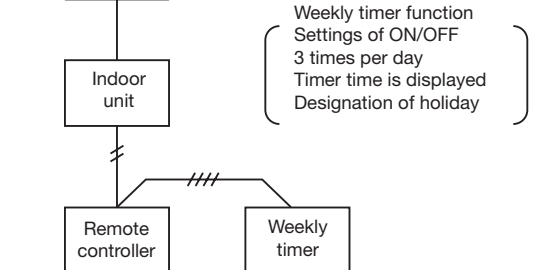

A combination of touch-screen and local server enables easy operation and user-friendly display.

###### 3-2-2. Windows-based plug-in central controller

The local server provides the central control function only by plug-in into a customer's computer.

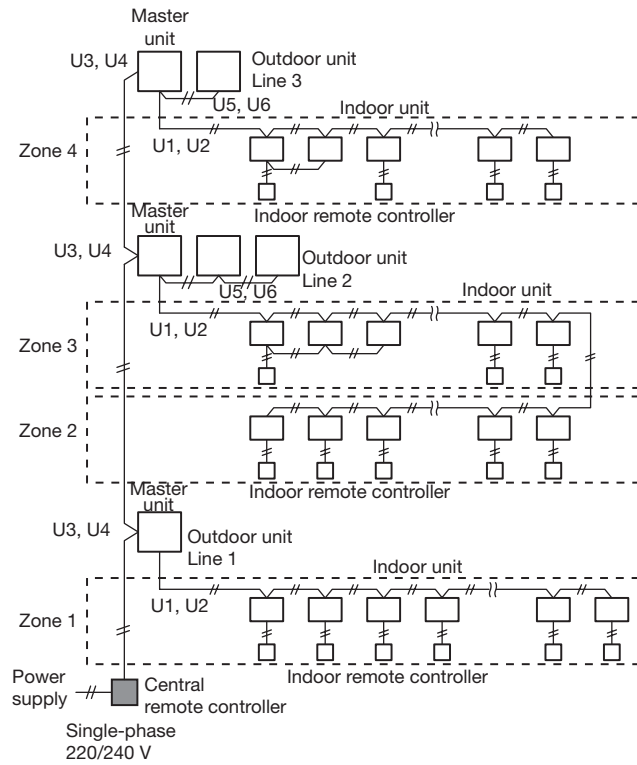

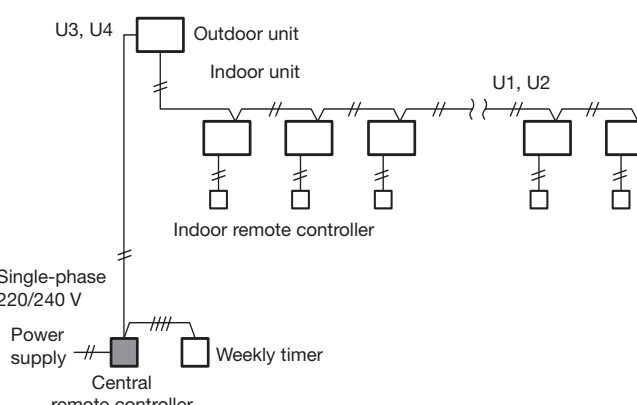

# 1. Applications for indoor remote controller

Basic function	System diagram	Model
<p><b>1-1 Individual control</b> Air conditioner is individually operated at a distance.</p>		<ul style="list-style-type: none"> <li>Wired remote controller <b>RBC-AMT31E</b></li> <li>Simplified remote controller <b>RBC-AS21E</b></li> <li>Wireless remote controller kit <b>TCB-AX21U(W)-E</b></li> <li><b>RBC-AX22CE</b></li> <li><b>TCB-AX21E</b></li> </ul>
<p><b>1-2 GROUP control</b> One remote controller can control a group of max. 8 indoor units. Operating on the same setting.</p>		<ul style="list-style-type: none"> <li>Wired remote controller <b>RBC-AMT31E</b></li> <li>Simplified remote controller <b>RBC-AS21E</b></li> </ul>

**Rated conditions:** Cooling: Indoor air temperature 27°C db/19°C wb, outdoor air temperature 35°C db  
Heating: Indoor air temperature 20°C db, outdoor air temperature 7°C db/6°C wb

\* Cooling capacities and electrical data are measured at the conditions specified by JIS B 8615, based on the reference piping which consists of 5 m of main piping and 2.5 m of branch piping connected with 0 metre height.

\*\* The sound pressure level is measured in an anechoic chamber in accordance with JIS B 8616. Normally the values measured in the actual operating environment become larger than the indicated values due to the effects of external sound.

\* Cooling capacities and electrical data are measured at the conditions specified by JIS B 8615, based on the reference piping which consists of 5 m of main piping and 2.5 m of branch piping connected with 0 metre height.

\*\* The sound pressure level is measured in an anechoic chamber in accordance with JIS B 8616. Normally the values measured in the actual operating environment become larger than the indicated values due to the effects of external sound.

\*\*\* Male screw connection one side

 Heating: Indoor air temperature 20°C db, outdoor air temperature 7°C db/6°C wb

\* Cooling capacities and electrical data are measured at the conditions specified by JIS B 8615, based on the reference piping which consists of 5 m of main piping and 2.5 m of branch piping connected with 0 metre height.

\*\* The sound pressure level is measured in an anechoic chamber in accordance with JIS B 8616. Normally the values measured in the actual operating environment become larger than the indicated values due to the effects of external sound.

\*\*\* Male screw connection one side

 Heating: Indoor air temperature 20°C db, outdoor air temperature 7°C db/6°C wb  
 The standard piping equals 5 m main pipe length plus 2.5 m branch pipe length.

\* The amount does not cover extra piping lengths. Refrigerant must be added on-site in accordance with the actual piping length.

\*\* The maximum total piping length is the sum of one-way piping lengths on the liquid side or gas side.

\*\*\* If the indoor unit is above, maximum lift is reduced to 30 m, if the height difference between indoor units exceeds 3 m.

## Wired remote controller (RBC-AMT31E)

### Legend

1. Hole for floor fixing
2. Service space
3. Air outlet
4. Ceiling board

5. G-Ø4.7 hole (front and rear each)
6. 4-Ø15 hole (for rear mounting)
7. 2-Ø4.7 hole (left/right side each)
8. 2-12 x 18 slot (hole for floor fixing)
9. Expansion valve box

All dimensions are given in mm.

# Indoor unit - floor-mounted cabinet unit

## MMF-AP0151H, AP0181H, AP0241H, AP0271H

Space required for service (for right-hand piping)

Refrigerant pipe positions

Model	ØA	ØB
MMF-AP0151H, AP0181H	1/2"	1/4"
MMF-AP0241H, AP0271H	5/8"	3/8"

Details of hole for rear piping

Details of hole for bottom piping

### Legend

1. Wall
2. With 50 mm wall clearance
3. Lower refrigerant pipe connection (50 x 120 knockout hole)
4. Installation plate
5. Air outlet
6. Air inlet
7. Refrigerant pipe connection (rear) (Ø130 knockout hole)
8. Drain hose
9. Refrigerant pipe connection (bottom) (50 x 120 knockout hole)
10. Earth screw M4
11. Refrigerant pipe connection (both sides) (Ø80 knockout hole)
12. Control panel
13. Panel cover
14. 2-lower hole (for M8 screw or M8 anchor bolt)
15. Ø130 knockout hole (for rear piping)
16. Refrigerant pipe connection (gas ØA)
17. Refrigerant pipe connection (liquid ØB)
18. 4-lower hole (for M8 screw or M8 anchor bolt)
19. 15 x 120 square hole (for bottom piping)
20. Floor

All dimensions are given in mm.

# Indoor unit - floor-mounted cabinet unit
