## Integrated FM tuner for radio receivers

## TDA1574T

### GENERAL DESCRIPTION

The TDA1574T is an integrated FM tuner circuit designed for use in the RF/IF section of car radios and home receivers. The circuit contains a mixer and an oscillator and a linear IF amplifier for signal processing. The circuit also incorporates the following features.

### Features

- Keyed Automatic Gain Control (AGC)
- Regulated reference voltage
- Buffered oscillator output
- Electronic standby switch
- Internal buffered mixer driving.

### QUICK REFERENCE DATA

PARAMETER	CONDITIONS	SYMBOL	MIN.	TYP.	MAX.	UNIT
Supply voltage range (pin 17)		$V_P$	7	–	14	V
Mixer input bias voltage (pins 1 and 2)		$V_{1,2-4}$	–	1	–	V
Noise factor		NF	–	9	–	dB
Oscillator output voltage (pin 6)		$V_{6-4}$	–	2	–	V
Output admittance at pin 6	$f = 108.7 \text{ MHz}$	$Y_{22}$	–	$1.5 + j2$		ms
Oscillator output buffer DC output voltage (pin 9)		$V_{9-4}$	–	6	–	V
Total harmonic distortion		THD	–	–15	–	dB
Linear IF amplifier output voltage (pin 12)		$V_{12-4}$	–	4.5	–	V
Noise factor	$R_S = 300 \Omega$	NF	–	6.5	–	dB
Keyed AGC output voltage range (pin 20)		$V_{20-4}$	0.5	–	$V_P - 0.3$	V

### PACKAGE OUTLINE

20-lead mini-pack; plastic (SO20; SOT163A); SOT163-1; 1996 September 9.

Integrated FM tuner for radio receivers

TDA1574T

**Coil data**

- L1: TOKO MC-108, 514HNE-150023S14; L = 0.078  $\mu$ H
- L2: TOKO MC-111, E516HNS-200057; L = 0.08  $\mu$ H
- L3: TOKO Coil set 7P, N1 = 5.5.5.5 turns, N2 = 4 turns

1.	Mixer input 1
2.	Mixer input 2
3.	Wideband information input
4.	Ground
5.	Voltage reference
6.	Oscillator output
7.	Oscillator input 1
8.	Oscillator input 2
9.	Buffered oscillator output
10.	Not connected
11.	Not connected
12.	IF output
13.	Standby switch
14.	Narrowband information input
15.	IF input 1
16.	IF input 2
17.	Supply voltage
18.	Mixer output 1
19.	Mixer output 2
20.	AGC output

## FUNCTIONAL DESCRIPTION

**Mixer**

The mixer circuit uses a double balanced multiplier with a preamplifier (common base input) in order to obtain a large signal handling range and low oscillator radiation.

**Oscillator**

The oscillator circuit uses an amplifier with a differential input. Voltage regulation is achieved by utilizing the symmetrical transfer function to obtain low order 2nd harmonics.

**Linear IF amplifier**

The IF amplifier is a one stage, differential input, wideband amplifier with an output buffer.

**Keyed AGC**

The AGC processor combines narrow and wideband information via an RF level detector, a comparator and an ANDing stage. The level dependent current sinking output has an active load which sets the AGC threshold.

The AGC function can either be controlled by a combination of wideband narrowband information (keyed AGC) or by a wideband/narrowband information only. If narrowband AGC is required pin 3 should be connected to pin 5. If wideband AGC is required pin 14 should be connected to pin 15.

## Integrated FM tuner for radio receivers

TDA1574T

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134); note 1.

PARAMETER	CONDITIONS	SYMBOL	MIN.	MAX.	UNIT
Supply voltage (pin 17)		$V_{17-4}$	–	14	V
Mixer output voltage (pins 18 and 19)		$V_{18,19-4}$	–	35	V
Standby switch input voltage (pin 13)		$V_{13-4}$	–	23	V
Reference voltage (pin 5)		$V_{5-4}$	–	7	V
Total power dissipation		$P_{tot}$	–	500	mW
Storage temperature range		$T_{stg}$	–55	+ 150	°C
Operating ambient temperature range		$T_{amb}$	–40	+ 85	°C

**Notes to the ratings**

1. All pins are short-circuit protected to ground.

**THERMAL RESISTANCE**

From junction to ambient (in free air)

$$R_{th\ j-a} = 95\ K/W$$

## Integrated FM tuner for radio receivers

TDA1574T

**CHARACTERISTICS** $V_P = V_{17-4} = 8.5 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; measured in test circuit Fig.1;

All measurements are with respect to ground (pin 4); unless otherwise specified

PARAMETER	CONDITIONS	SYMBOL	MIN.	TYP.	MAX.	UNIT
<b>Supply (pin 17)</b>						
Supply voltage	$V_P = V_{17}$	$V_{17}$	7	–	14	V
Supply current (except mixer)	$I_P = I_{17}$	$I_{17}$	16	23	30	mA
Reference voltage (pin 5)		$V_5$	4.0	4.2	4.4	V
<b>Mixer</b>						
<b>DC characteristics</b>						
Input bias voltage (pins 1 and 2)		$V_{1,2}$	–	1	–	V

<b>Keyed AGC</b>						
<b>DC characteristics</b>						
Output voltage range (pin 20)		$\Delta V_{20}$	0.5	–	$V_P - 0.3$	V
AGC output current						
at $I_3 = 0$ or $V_{14} = 450$ mV; $V_{20} = V_P/2$		$-I_{20}$	25	50	100	$\mu$ A
at $V_3 = 2$ V and $V_{14} = 1$ V; $V_{20} = V_{15}$		$I_{20}$	2	–	5	mA
Narrowband threshold						
at $V_3 = 2$ V; $V_{14} = 550$ mV		$V_{20}$	–	–	1	V
at $V_3 = 2$ V; $V_{14} = 450$ mV		$V_{20}$	$V_P - 0.3$	–	–	V
<b>AC characteristics</b>	$f_i = 98$ MHz					
Input impedance		$R_3$	–	4	–	k $\Omega$
		$C_3$	–	3	–	pF

## Integrated FM tuner for radio receivers

## TDA1574T

PARAMETER	CONDITIONS	SYMBOL	MIN.	TYP.	MAX.	UNIT
Wideband threshold (RMS value) (see Figs 3, 4, 5 and 6) at $V_{14} = 0.7$ V; $V_{20} = V_P/2$ ; $I_{20} = 0$		$EMF_{2(rms)}$	–	17	–	mV
<b>Oscillator output buffer</b> (pin 9)						
DC output voltage		$V_9$	–	6	–	V
Oscillator output voltage (RMS value) at $R_L = \infty$ ; $C_L = 2$ pF at $R_L = 75$ $\Omega$		$V_{9(rms)}$	–	110	–	mV
		$V_{9(rms)}$	30	50	–	mV
DC output resistance		$R_{9-17}$	–	2.5	–	k $\Omega$
Signal purity						
Total harmonic distortion		THD	–	–15	–	dB
Spurious frequencies at $EMF_1 = 1$ V; $R_{S1} = 50$ $\Omega$		$f_s$	–	–35	–	dB
<b>Electronic standby switch</b> (pin 11)						
Oscillator; linear IF amplifier; AGC	$T_{amb} = -40$ to $+85$ $^{\circ}C$					
Input switching voltage for threshold ON	$V_{20} = > V_P - 3$ V	$V_{13}$	0	–	2.3	V
for threshold OFF	$V_{20} = < 0.5$ V	$V_{13}$	3.3	–	23	V
Input current at ON condition	$V_{13} = 0$ V	$-I_{13}$	–	–	150	$\mu A$
at OFF condition	$V_{13} = 23$ V	$-I_{13}$	–	–	10	$\mu A$
Input voltage	$I_{13} = 0$	$V_{13}$	–	–	4.4	V

**Notes to the characteristics**

1. Power gain conversion is equated by the following equation:

$$10 \log \frac{4 (V_{M(out)} 10.7 \text{ MHz})^2}{(EMF_1 98 \text{ MHz})^2} \times \frac{R_{S1}}{R_{ML}}$$

2. Voltage gain is equated by the following equation:

$$20 \log \frac{V_{12}}{V_{16-15}}$$

### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "*IC Package Databook*" (order code 9398 652 90011).

#### Reflow soldering

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

#### Wave soldering

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

**DEFINITIONS**

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

**LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
