

# SignalOn® Series

## RF Signal Management

Advanced broadband services are being developed and launched at an ever-accelerating pace. While these services vary, they have one thing in common. Whether it be high-speed data, video-on-demand, or IP telephony, broadband subscribers expect a reliable, high-quality experience at an affordable price.

ADC's SignalOn® Series has been designed with these demanding service requirements in mind. This next generation RF signal management platform provides unmatched density, RF performance, and reliability—all at a competitive price. With its patented hitless "make-before-break" attenuator circuit design, maintaining your RF signal network has never been easier.

## RF Signal Management

### Passives: Introduction

The SignalOn® Series, combined with the innovative cable management of the chassis, provides engineers with a variety of products to simplify the RF signal management challenge.

### Passives: RF Splitter/Combiner Modules 5 MHz to 1 GHz

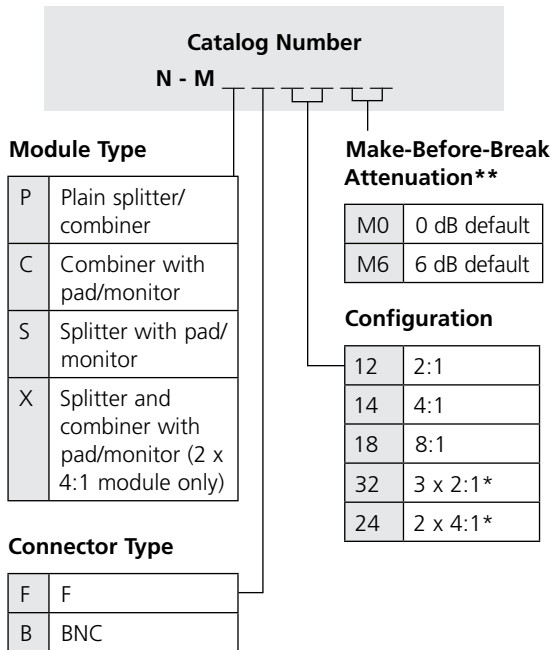

Plain Splitter/Combiner Module

Pad and Monitor Module with Make-Before-Break Attenuation

SignalOn® Series  
5/08 • 102721AE

\*3 x 2:1 and 2 x 4:1 housed in a single module.

\*\*Leave last two digits blank for plain modules.

#### Features

- Industry's highest density with standard F and BNC connectors
- Industry's best performance and specifications
- Individual performance certificate shipped with every module
- Patented make-before-break attenuator pad design for hitless signal balancing
- Chassis supports both passive and active modules
- Clear chassis door provides protection and clear view of modules
- Clear attenuator pad covers and patented pad guides for simplified maintenance
- High quality, precision F or BNC connectors
- Designed to exceed NEBS requirements for grounding/bonding
- Independent EMI near and far-field testing
- Ten year warranty on all passive modules
- Available in 1 RU, 2 RU, 4 RU and 5 RU chassis
- NEBS Level 3 compliant

### Selection of default pad option for pad and monitor modules

The make before break attenuation feature requires that a default attenuation padding value be chosen for the module. The two options are:

#### M0 – 0 dB loss on the splitter or combiner leg when attenuator pad is removed

The M0 option is used in systems where the attenuator pad values will range from 0 dB to 10 dB.

#### M6 – 6 dB loss on the splitter or combiner leg when attenuator pad is removed

The M6 option is typically used in systems where the attenuator pad values range from 10 dB to 25 dB. In this situation, the additional 6 dB of loss that is placed in line when the pad is removed will help to limit overdriving active devices further downstream and will help limit transmitter laser clipping, and overdriving of RF amplifiers in the distribution plant.

### Passives: L-Band Satellite Splitter Modules

#### 950 MHz to 2.15 GHz

ADC's new L-Band series satellite splitter modules are engineered for the highest performance in the 950 MHz to 2.15 GHz frequency range. These plain splitter/combiner modules feature dual port **power-passing** capability for powering LNB's. All L-Band modules are available with precision F or BNC connectors, and are NEBS Level 3 compliant.

## RF Signal Management

### Actives: Introduction

Today's broadband services require high-quality headend infrastructure that offers excellent performance, reliability and design flexibility. Furthermore, your infrastructure solution should maximize the uptime of carrier-class services like VoIP, VOD and HSD as applications evolve and your network changes.

Leveraging over a decade of RF amplifier design experience, ADC's SignalOn® amplifiers have been engineered to meet these demanding service requirements. Featuring operation from 50 MHz to 1 GHz, the amplifiers offer excellent performance and reliability. SignalOn amplifiers and associated power supplies can be housed in the same chassis as the SignalOn passive products for increased design flexibility. With its electronically variable gain and slope controls, you can adjust signal levels in your network with no service downtime.

SignalOn amplifiers feature non-service-affecting gain and slope controls. This capability along with the patented make-before-break attenuator pad design of the splitters and combiners, allow for "hitless" RF signal adjustment—critical for today's carrier-class broadband service applications.

#### Features

- Operation from 50 MHz to 1 GHz
- GaAs technology with near-100% surface mount design for high performance
- Meets MIL-202 specs for quality and reliability
- Mounts in same SignalOn chassis as passive modules for maximum design flexibility
- Digitally variable gain and slope control for non-service-affecting signal level adjustments
- 20 dB monitor points on both input and output signals for testing and troubleshooting
- "Blind-mate" power bus connector with gold-on-gold contacts; requires no cabling
- Chassis-mounted AC-DC and DC-DC power supply options
- Redundant powering with dual load shared power supplies for increased availability
- External +24 Vdc powering option
- NEBS Level 3 compliant

## RF Signal Management

### Actives: RF Switch Modules

The ADC SignalOn® RF Switch Module (RFSM) is designed for use with the SignalOn 8-position, or 20-position powered chassis. All RF connections to the switch are made through standard 75 Ω BNC, or F connectors on the rear of the module. All operating controls and indicators are located on the front panel with configuration controls located on the rear of the module.

The primary function of the module is to monitor the RF signal gain of the operating primary "A" input, and switch to the backup "B" input if the gain of the primary path rises, or falls below the pre-set customer selected threshold. Should the "A" input side go above, or fall below the threshold of the unit, the RFSM will rapidly switch the input from the failed input to the secondary input. This switch usually is less than 10 milliseconds. Switch status, failure LEDs, and RF level bar graphs are mounted on the front panel of the switch module. Switching threshold: +/- 3 dB or +/- 6 dB, and alarm contact closures are located on the rear of module.

**Dual RF Switch Module**

5/08 • 102721AE SignalOn® Series

#### Features

- Continuous monitoring of primary and secondary
- Detects both high and low power failures
- User-selectable switching threshold: +/- 3 dB or +/- 6 dB
- Fail-over switching time < 10 ms
- Automatic switchback after "A" path is restored
- Front-panel LED status and dual power level displays
- Alarm contact for remote failure monitoring
- Available in BNC and F-connector configurations
- Single or dual modules
- Easily configured for redundancy or A-B switch applications
- Front panel bar graph display provides indication of RF power and switching threshold
- Indication of switch status provided by front panel LED and rear terminal block contacts
- Easily configured switching threshold levels via rear DIP switch
- One-step calibration
- Auto switch-back feature to primary input
- Built-in delay to prevent from false switching
- Automatic or manual modes of operation
- NEBS Level 3 compliant

## RF Signal Management

### Actives: Reverse Path Amplifier Modules

ADC's Return Path Amplifier was designed specifically to solve problems particular to your environment. Providing greater density, unparalleled cable management, greater functionality and redundant powering, the return path amplifier is part of the system approach to integrating all signal management functions in a common format and modular system.

To mount modules in SignalOn chassis use these amplifiers in conjunction with N-ACC-BRKT-RA (mounts 1 or 2 amps) – see page 16.

Reverse Path Amplifier

#### Features

- Fixed 22 dB
- Low distortion characteristics
- Low noise figure
- 5-200 MHz bandwidth
- Two 20 dB monitor ports (input and output)
- BNC or F connectors
- AC or DC powering
- Power redundancy (optional)
