## 1 OVERVIEW

Congratulation on your purchase of Altina, which manufacture and provide various GPS applications. Altina's **GGM308** GPS Receiver provides you various applications such as car navigation, marine navigation, mapping, surveying, security, agriculture and so on. It communicates with device (such as PocketPC or notebook) via compatible dual-channel through RS-232 or TTL and saves satellite data by built-in backup memory. Low power consumption technology enables **GGM308** and your device to save more operating power. Furthermore, **GGM308** can track up to 12 satellites at a time, re-acquire satellite signals in 100ms and update position data every second. Trickle-Power allows the unit to operate a fraction of the time, and Push-to-Fix permits user to have a quicker position fix even though the receiver stays off.

## 5.8. RTCM Received Data

The default communication parameters for DGPS Input are 4800 baud, 8 data bits, stop bit, and no parity. Position accuracy of less than 5 meters can be achieved with the **GGM-308** by using Differential GPS (DGPS) real-time pseudo-range correction data in RTCM SC-104 format, with message types 1, 2 or 9. As using DGPS receiver with different communication parameters, **GGM-308** may decode the data correctly to generate accurate messages and save them in battery-back SRAM for later computing.
