

**Application Notes for Configuring Sagemcom XMediusFAX
Service Provider Edition with Avaya Aura® Session
Manager and Avaya Aura® Communication Manager
- Issue 1.0**

Abstract

These Application Notes describe the procedures for configuring Sagemcom XMediusFAX Service Provider (SP) Edition with Avaya Aura® Session Manager and Avaya Aura® Communication Manager.

XMediusFAX is a software based fax server that sends and receives fax calls over an IP network. In the configuration tested, XMediusFAX interoperates with Avaya Aura® Session Manager and Avaya Aura® Communication Manager to send/receive faxes using SIP trunks and the T.38 fax protocol between XMediusFAX and the Avaya SIP infrastructure.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the procedures for configuring Sagemcom XMediusFAX Service Provider (SP) Edition with Avaya Aura® Session Manager and Avaya Aura® Communication Manager using SIP trunks.

XMediusFAX is a software based fax server that sends and receives fax calls over an IP network. In the configuration tested, XMediusFAX interoperates with the Session Manager and Communication Manager to send/receive faxes using SIP trunks and the T.38 protocol between XMediusFAX and the Avaya SIP infrastructure. The compliance testing focused on fax calls to and from the XMediusFAX fax server using various page lengths, resolutions, and fax data speeds.

2. General Test Approach and Test Results

This section describes the general test approach used to verify the interoperability of Sagemcom XMediusFAX SP Edition with the Avaya SIP infrastructure (Session Manager and Communication Manager). This section also covers the test results.

2.1. Interoperability Compliance Testing

The general test approach was to make intra-site and inter-site fax calls to and from the XMediusFAX fax server. The compliance tested configuration contained two sites. Site 2 served as the main enterprise site and Site 1 served as a simulated PSTN or a remote enterprise site. Inter-site calls and simulated PSTN calls were made using SIP trunks and ISDN-PRI trunks between the sites. By using two Communication Managers and two port networks at Site 1, fax calls across multiple TDM/IP hops were able to be tested. Faxes were sent with various page lengths, resolutions, and at various fax data speeds. For capacity testing, 100 2-page faxes were continuously sent between the two XMediusFAX fax servers. Serviceability testing included verifying proper operation/recovery from network outages, unavailable resources, and Communication Manager and XMediusFAX restarts. Fax calls were also tested with different Avaya Media Gateway media resources to process the fax data. This included the TN2302 MedPro circuit pack, the TN2602 MedPro circuit pack in the Avaya G650 Media Gateway; and the integrated VoIP engine of the Avaya G450 Media Gateway.

2.2. Test Results

XMediusFAX successfully passed compliance testing.

2.3. Support

For technical support on XMediusFAX, contact Sagemcom at:

- Web: <http://xmediusfax.sagemcom.com/support/>
- Phone: (888) 766-1668
- Email: xmediusfax.support.americas@sagemcom.com

- A Dell™ PowerEdge™ R610 Server running Avaya Aura® System Manager. System Manager provides management functions for Session Manager.
- An HP ProLiant DL360 G7 Server running Avaya Aura® Session Manager.
- XMediusFAX running on a Windows 2008 R2 Enterprise Server (SP1).
- An analog fax machine
- Various Avaya IP endpoints (not all shown).

Although the IP endpoints (H.323 and SIP telephones) are not involved in the faxing operations, they are present at both sites to verify that VoIP telephone calls are not affected by the FoIP faxing operations and vice versa.

Outbound fax calls originating from the XMediusFAX fax server are sent to Session Manager first, and then from Session Manager to Communication Manager via SIP trunks. Based on the dialed digits, Communication Manager will either direct the calls to the local fax machine, or to the other site via an ISDN-PRI or SIP trunk. Inbound fax calls terminating to the XMediusFAX fax server are sent from the local fax machine or from the remote site are received by Communication Manager. The calls are then directed to Session Manager for onward routing to the XMediusFAX fax server via SIP trunks.

4. Equipment and Software Validated

The following equipment and software were used for the reference configuration:

Equipment	Software
Site 1	
Avaya S8800 Server with a Avaya G650 Media Gateways: <ul style="list-style-type: none"> - 2 CLANs – TN799DP - 2 IP MedPros – TN2302AP - 2 IP MedPros – TN2602AP 	Avaya Aura® Communication Manager 6.0.1, R016x.00.1.510.1, Patch 19009 : <ul style="list-style-type: none"> - HW01, FW038 - HW20, FW120 - HW02, FW57

5. Configure Communication Manager

This section describes the Communication Manager configuration at Site 2 to support the network shown in **Figure 1**. Although not shown in this document, a similar Communication Manager configuration would be required at Site 1.

The configuration of Communication Manager was performed using the System Access Terminal (SAT). After the completion of the configuration, perform a **save translation** command to make the changes permanent.

Step	Description
1.	<p>License</p> <p>Use the display system-parameters customer-options command to verify that the Communication Manager license has proper permissions for features illustrated in these Application Notes. Navigate to Page 2, and verify that there is sufficient remaining capacity for SIP trunks by comparing the Maximum Administered SIP Trunks field value with the corresponding value in the USED column.</p> <p>The license file installed on the system controls the maximum permitted. If there is insufficient capacity, contact an authorized Avaya sales representative to make the appropriate changes.</p> <pre> display system-parameters customer-options Page 2 of 11 OPTIONAL FEATURES IP PORT CAPACITIES USED Maximum Administered H.323 Trunks: 12000 32 Maximum Concurrently Registered IP Stations: 18000 15 Maximum Administered Remote Office Trunks: 12000 0 Maximum Concurrently Registered Remote Office Stations: 18000 0 Maximum Concurrently Registered IP eCons: 414 0 Max Concur Registered Unauthenticated H.323 Stations: 100 0 Maximum Video Capable Stations: 18000 0 Maximum Video Capable IP Softphones: 18000 1 Maximum Administered SIP Trunks: 24000 170 Maximum Administered Ad-hoc Video Conferencing Ports: 24000 0 Maximum Number of DS1 Boards with Echo Cancellation: 522 0 Maximum TN2501 VAL Boards: 128 0 Maximum Media Gateway VAL Sources: 250 1 Maximum TN2602 Boards with 80 VoIP Channels: 128 0 Maximum TN2602 Boards with 320 VoIP Channels: 128 0 Maximum Number of Expanded Meet-me Conference Ports: 300 0 (NOTE: You must logoff & login to effect the permission changes.) </pre>

Step	Description
2.	<p>IP network region Use the display ip-network-region command to view the network region settings. The values shown below are the values used during compliance testing.</p> <ul style="list-style-type: none"> ▪ Authoritative Domain: <i>avaya.com</i> This field was configured to match the domain name configured on Session Manager. The domain will appear in the “From” header of SIP messages originating from this IP region. ▪ Name: Any descriptive name may be used (if desired). ▪ Intra-region IP-IP Direct Audio: <i>yes</i> Inter-region IP-IP Direct Audio: <i>yes</i> By default, IP-IP direct audio (media shuffling) is enabled to allow audio traffic to be sent directly between IP endpoints without using media resources in the Avaya Media Gateway. Shuffling can be further restricted at the trunk level on the Signaling Group form. ▪ Codec Set: <i>1</i> The codec set contains the list of codecs available for calls within this IP network region. <pre> Display ip-network-region 1 Page 1 of 20 IP NETWORK REGION Region: 1 Location: Authoritative Domain: avaya.com Name: FAX testing MEDIA PARAMETERS Codec Set: 1 Intra-region IP-IP Direct Audio: yes Inter-region IP-IP Direct Audio: yes UDP Port Min: 2048 IP Audio Hairpinning? n UDP Port Max: 3329 DIFFSERV/TOS PARAMETERS Call Control PHB Value: 46 Audio PHB Value: 46 Video PHB Value: 26 802.1P/Q PARAMETERS Call Control 802.1p Priority: 6 Audio 802.1p Priority: 6 Video 802.1p Priority: 5 AUDIO RESOURCE RESERVATION PARAMETERS H.323 IP ENDPOINTS RSVP Enabled? n H.323 Link Bounce Recovery? y Idle Traffic Interval (sec): 20 Keep-Alive Interval (sec): 5 Keep-Alive Count: 5 </pre>

Step	Description
3.	<p data-bbox="315 235 1403 378">Codecs IP codec set 1 was used during compliance testing. Multiple codecs can be listed in priority order to allow the codec used by a specific call to be negotiated during call establishment. The example below shows the values used during compliance testing.</p> <pre data-bbox="315 415 1323 661"> display ip-codec-set 1 Page 1 of 2 IP Codec Set Codec Set: 1 Audio Silence Frames Packet Codec Suppression Per Pkt Size(ms) 1: G.711MU n 2 20 2: </pre> <p data-bbox="315 724 1425 793">On Page 2, set the FAX Mode field to <i>t.38-standard</i>. The Modem Mode field should be set to <i>off</i>.</p> <p data-bbox="315 835 1425 1087">Leave the FAX Redundancy setting at its default value of <i>0</i>. A packet redundancy level can be assigned to improve packet delivery and robustness of FAX transport over the network (with increased bandwidth as trade-off). Avaya uses IETF RFC-2198 and ITU-T T.38 specifications as redundancy standard. With this standard, each Fax over IP packet is sent with additional (redundant) 0 to 3 previous fax packets based on the redundancy setting. A setting of 0 (no redundancy) is suited for networks where packet loss is not a problem.</p> <pre data-bbox="315 1129 1323 1444"> display ip-codec-set 1 Page 2 of 2 IP Codec Set Allow Direct-IP Multimedia? y Maximum Call Rate for Direct-IP Multimedia: 2048:Kbits Maximum Call Rate for Priority Direct-IP Multimedia: 2048:Kbits FAX Mode Redundancy FAX t.38-standard 0 Modem off 0 TDD/TTY US 3 Clear-channel n 0 </pre>

Step	Description
6.	<p>Trunk Group</p> <p>Trunk group 1 was used for the SIP trunk group between Communication Manager and Session Manager. The signaling groups and trunk groups between the two sites of the reference configuration is assumed to already be in place and not described in this document. Trunk group 1 was configured using the parameters highlighted below.</p> <ul style="list-style-type: none"> ▪ Group Type: sip This field sets the type of the trunk group. ▪ TAC: 101 Enter an valid value consistent with the Communication Manager dial plan ▪ Member Assignment Method: auto Set to Auto. ▪ Signaling Group: 1 This field is set to the signaling group shown in the previous step. ▪ Number of Members: 50 This field represents the number of trunk group members in the SIP trunk group. It determines how many simultaneous SIP calls can be supported by the configuration. Each SIP call between two SIP endpoints (whether internal or external) requires two SIP trunks for the duration of the call. Thus, a call from a SIP telephone to another SIP telephone will use two SIP trunks. A call between a non-SIP telephone and a SIP telephone will only use one trunk.
	<pre> display trunk-group 1 Page 1 of 21 TRUNK GROUP Group Number: 1 Group Type: sip CDR Reports: y Group Name: to SM_21_31 COR: 1 TN: 1 TAC: 101 Direction: two-way Outgoing Display? n Dial Access? n Night Service: Queue Length: 0 Service Type: tie Auth Code? n Member Assignment Method: auto Signaling Group: 1 Number of Members: 50 </pre>

Step	Description
	<p>Trunk Group – continued On Page 3:</p> <ul style="list-style-type: none"> ▪ The Numbering Format field was set to <i>unk-pvt</i>. 6. Configure Session Manager

This section provides the procedures for configuring Session Manager (version 6.1) as provisioned at Site 2 in the reference configuration. Although not shown in this document, a similar Session Manager configuration would be required at Site 1 (using the appropriate version 6.0 screens). All provisioning for Session Manager is performed via the System Manager web interface.

The following sections assume that Session Manager and System Manager have been installed and that network connectivity exists between the two platforms.

The Session Manager server provides the network interface for all inbound and outbound SIP signaling and media transport to all provisioned SIP entities. During compliance testing, the IP address assigned to the Security Module interface is 10.64.21.31 as specified in **Figure 1**. The Session Manager server also has a separate network interface used for connectivity to System Manager for provisioning Session Manager. The IP address assigned to the Session Manager management interface is 10.64.21.30.

The procedures described in this section include configurations in the following areas:

- **SIP Domains** – SIP Domains are the domains for which Session Manager is authoritative in routing SIP calls. In other words, for calls to such domains, Session Manager applies Network Routing Policies to route those calls to SIP Entities. For calls to other domains, Session Manager routes those calls to another SIP proxy (either a pre-defined default SIP proxy or one discovered through DNS).
- **Locations** – Locations define the physical and/or logical locations in which SIP Entities reside. Call Admission Control (CAC) / bandwidth management may be administered for each location to limit the number of calls to and from a particular Location.
- **Adaptations** – Adaptations are used to apply any necessary protocol adaptations, e.g., modify SIP headers, and apply any necessary digit conversions for the purpose of interworking with specific SIP Entities.
- **SIP Entities** – SIP Entities represent SIP network elements such as Session Manager instances, Communication Manager systems, Session Border Controllers, SIP gateways, SIP trunks, and other SIP network devices.
- **Entity Links** – Entity Links define the SIP trunk/link parameters, e.g., ports, protocol (UDP/TCP/TLS), and trust relationship, between Session Manager instances and other SIP Entities.
- **Time Ranges** – Time Ranges specify customizable time periods, e.g., Monday through Friday from 9AM to 5:59PM, Monday through Friday 6PM to 8:59AM, all day Saturday and Sunday, etc. A Network Routing Policy may be associated with one or more Time Ranges during which the Network Routing Policy is in effect.
- **Routing Policies** – Routing Policies are used in conjunction with a Dial Patterns to specify a SIP Entity that a call should be routed to.
- **Dial Patterns** – A Dial Pattern specifies a set of criteria and a set of Network Routing Policies for routing calls that match the criteria. The criteria include the called party number and SIP domain in the Request-URI, and the Location from which the call originated. For

example, if a call arrives at Session Manager and matches a certain Dial Pattern, then Session Manager selects one of the Network Routing Policies specified in the Dial Pattern. The selected Network Routing Policy in turn specifies the SIP Entity to which the call is to be routed.

1.

Login

Access the System Manager administration web interface by entering `https://<ip-addr>/SMGR/` as the URL in an Internet browser, where `<ip-addr>` is the IP address of the System Manager server.

Log in with the appropriate credentials. The main page for the administrative interface is shown below.

The screenshot shows the Avaya Aura™ System Manager 6.1 administrative interface. At the top left is the Avaya logo. To its right is the text "Avaya Aura™ System Manager 6.1". At the top right are links for "Help | About | Change Password | Log off admin". The main content area is a grid of three columns, each with a header and a list of menu items:

- Users**

2.

Add SIP Domain

The **Routing** menu contains all the configuration tasks listed at the beginning of this section.

During compliance testing, one SIP Domain was configured.

Navigate to **Routing**→**Domains**, and click the **New** button (not shown) to add the SIP domain with

- **Name:** *avaya.com* (as set in **Section 5, Step 2**)
- **Notes:** optional descriptive text

Click **Commit** to save the configuration.

3.

Add Location

Locations identify logical and/or physical locations where SIP entities reside. Only one Location was configured at each site for compliance testing.

Navigate to **Routing**→**Locations** and click the **New** button (not shown) to add the Location.

Under **General**:

- **Name**: a descriptive name
- **Notes**: optional descriptive text

Under **Location Pattern**, click the **Add** button to add a new line:

- **IP Address Pattern**: **10.64.21.***
- **Notes**: optional descriptive text

Click **Commit** to save the configuration.

4.

Add Adaptation

An Adaptation was created and applied to the “Fax Server” SIP entity to override the destination domain as shown below.

The `ingressOverrideDestinationDomain (iodstd) Module parameter` replaces the domain in the Request-URI, To Header (if administered), and Notify/message-summary body with the given value (e.g. **avaya.com**) for ingress only.

The override `DestinationDomain (odstd) Module parameter` replaces the domain in the Request-URI, To Header (if administered), Refer-To header, and Notify/message-summary body with the given value (e.g. the IP address of the fax server **10.64.21.202**) for egress only.

The screenshot displays the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the title 'Avaya Aura® System Manager 6.1', and user options: 'Help | About | Change Password | Log off admin'. The breadcrumb trail is 'Home / Elements / Routing / Adaptations - Adaptation Details'. A left-hand menu lists various configuration categories: Routing, Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Adaptation Details' and contains a 'General' section with the following fields: 'Adaptation name' (Fax Server Domain), 'Module name' (DigitConversionAdapter), 'Module parameter' (iodstd=avaya.com odstd=10.64.2), 'Egress URI Parameters', and 'Notes'. Below this are two sections for 'Digit Conversion for Incoming Calls to SM' and 'Digit Conversion for Outgoing Calls from SM', each with an 'Add' and 'Remove' button and a table with columns: Matching Pattern, Min, Max, Phone Context, Delete Digits, Insert Digits, Address to modify, and Notes. At the bottom, there is a '* Input Required' message and 'Commit' and 'Cancel' buttons.

5.

Add SIP Entities

A SIP Entity must be added for Session Manager and for each SIP-based telephony system supported by it using SIP trunks. During compliance testing, a SIP Entity was added for the Session Manager itself, Communication Manager, and the XMediusFAX fax server.

Navigate to **Routing**→**SIP Entities**, and click the **New** button (not shown) to add a SIP Entity. The configuration details for the SIP Entity defined for Session Manager are as follows:

Under **General**:

- **Name**: a descriptive name
- **FQDN or IP Address**: **10.64.21.31** as specified in **Figure 1**. This is the IP address assigned to the SM-100 security module installed in the Session Manager.
- **Type**: select **Session Manager**

Under **Port**, click **Add**, then edit the fields in the resulting new row as shown below:

- **Port**: **5061**. This is the port number on which the system listens for SIP requests.
- **Protocol**: **TLS**. The TLS transport protocol was used between Session Manager and Communication Manager.
- **Default Domain**: select the SIP Domain created in **Step 2**.
- Repeat the three bullets above, but select **5060** for **Port** and **UDP** for **Protocol**. The UDP protocol was used between Session Manager and the XMediusFAX fax server.

Default settings can be used for the remaining fields. Click **Commit** to save the SIP Entity definition.

Add SIP Entities (continued) – Session Manager

The screens below show the SIP Entity configuration details for the Session Manager.

<input type="checkbox"/>	<input type="text" value="SM_21_31"/>	<input type="text" value="TLS"/>	<input type="text" value="* 5061"/>	<input type="text" value="CM_21_41"/>	<input type="text" value="* 5061"/>	<input checked="" type="checkbox"/>

Add SIP Entities (continued) – XMediusFax

The screen below shows the SIP Entity configuration details for the XMediusFAX fax server. Note the **Other** selection for **Type**, and the **Adaptation** created **Step 4** of this section is selected.

The screenshot displays the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura® System Manager 6.1", and utility links for "Help | About | Change Password | Log off admin". A breadcrumb trail shows "Home / Elements / Routing / SIP Entities - SIP Entity Details". A left-hand menu lists various configuration categories, with "SIP Entities" highlighted. The main content area is titled "SIP Entity Details" and contains a "General" section with the following fields: "Name" (Fax Server), "FQDN or IP Address" (10.64.21.202), "Type" (Other), "Notes" (empty), "Adaptation" (Fax Server Domain), "Location" (.21 Subnet), and "Time Zone" (America/Denver). There is an unchecked checkbox for "Override Port & Transport with DNS SRV". Below this are "SIP Timer B/F (in seconds)" (4), "Credential name" (empty), and "Call Detail Recording" (none). A "SIP Link Monitoring" section includes "SIP Link Monitoring" (Link Monitoring Disabled), "Proactive Monitoring Interval (in seconds)" (900), "Reactive Monitoring Interval (in seconds)" (120), and "Number of Retries" (1). "Commit" and "Cancel" buttons are located in the top right corner of the configuration area.

6.

Add Entity Links

A SIP trunk between Session Manager and a telephony system is described by an Entity link. Two Entity Links were created: one between Session Manager and Communication Manger; the other between Session Manager and the XMediusFAX fax server.

Navigate to **Routing**→**Entity Links**, and click the **New** button (not shown) to add a new Entity Link. The screen below shows the configuration details for the Entity Link connecting Session Manager to Communication Manager.

- **Name:** a descriptive name
- **SIP Entity 1:** select the Session Manager SIP Entity.
- **Port: 5061.** This is the port number to which the other system sends SIP requests.
- **SIP Entity 2:** select the Communication Manager SIP Entity.
- **Port: 5061.** This is the port number on which the other system receives SIP requests.
- **Trusted:** check this box
- **Protocol:** select **TLS** as the transport protocol.
- **Notes:** optional descriptive text

Click **Commit** to save the configuration.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the product name 'Avaya Aura™ System Manager 6.1', and utility links for 'Help | About | Change Password | Log off admin'. The breadcrumb trail is 'Home / Elements / Routing / Entity Links- Entity Links'. A left-hand menu lists various configuration categories, with 'Entity Links' selected. The main content area displays a table with one configuration item. The table has columns for Name, SIP Entity 1, Protocol, Port, SIP Entity 2, Port, Trusted, and Notes. The row shows 'CM_21_41' as the name, 'SM_21_31' as SIP Entity 1, 'TLS' as the protocol, and '5061' as the port for both directions. The 'Trusted' checkbox is checked. There are 'Commit' and 'Cancel' buttons at the top right and bottom right of the configuration area.

Name	SIP Entity 1	Protocol	Port	SIP Entity 2	Port	Trusted	Notes
* CM_21_41	* SM_21_31	TLS	* 5061	* CM_21_41	* 5061	<input checked="" type="checkbox"/>	

Add Entity Links (continued)

The Entity Link for connecting Session Manager to the XMediusFAX fax server was similarly defined as shown in the screen below.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura® System Manager 6.1", and links for "Help", "About", "Change Password", and "Log off admin". A breadcrumb trail reads "Home / Elements / Routing / Entity Links - Entity Links".

On the left is a navigation menu with the following items: Routing, Domains, Locations, Adaptations, SIP Entities, Entity Links (highlighted), Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults.

The main content area is titled "Entity Links" and contains a table with the following data:

Name	SIP Entity 1	Protocol	Port	SIP Entity 2	Port	Trusted	Notes
* Fax Server	* SM_21_31	UDP	* 5060	* Fax Server	* 5060	<input checked="" type="checkbox"/>	

Below the table, there is a message: "* Input Required".

Buttons for "Commit" and "Cancel" are located at the top right and bottom right of the configuration area.

7.

Add Time Ranges

Before adding routing policies (configured in next step), time ranges must be defined during which the policies will be active. One Time Range was defined that would allow routing to occur at anytime.

Navigate to **Routing**→**Time Ranges**, and click the **New** button to add a new Time Range:

- **Name:** a descriptive name
- **Mo through Su:** check the box under each of these headings
- **Start Time:** enter **00:00**
- **End Time:** enter **23:59**

Click **Commit** to save this time range. The screen below shows the configured Time Range.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the product name 'Avaya Aura™ System Manager 6.1', and user options like 'Help | About | Change Password | Log off admin'. The breadcrumb trail is 'Home / Elements / Routing / Time Ranges- Time Ranges'. A left sidebar lists various configuration categories, with 'Time Ranges' highlighted. The main content area shows a 'Time Ranges' section with buttons for 'Edit', 'New', 'Duplicate', 'Delete', and 'More Actions'. Below this is a table with one item:

<input type="checkbox"/>	Name	Mo	Tu	We	Th	Fr	Sa	Su	Start Time	End Time	Notes
<input type="checkbox"/>	24/7	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	00:00	23:59	Time Range 24/7

Below the table, there is a 'Select : All, None' option and a 'Filter: Enable' link.

8.

Add Routing Policies

Routing policies describe the conditions under which calls will be routed to the SIP Entities connected to the Session Manager. Two routing policies were added – one for routing calls to Communication Manager, and the other for routing calls to the XMediusFAX fax server.

Navigate to **Routing**→**Routing Policies**, and click the **New** button (not shown) to add a new Routing Policy.

Under **General**:

- **Name**: a descriptive name
- **Notes**: optional descriptive text

Under **SIP Entity as Destination**

Click **Select** to select the appropriate SIP Entity to which the routing policy applies (not shown).

Under **Time of Day**

Click **Add** to select the Time Range configured in the previous step (not shown).

Default settings can be used for the remaining fields. Click **Commit** to save the configuration.

Add Routing Policies (continued)

The screens below show the configuration details for the two Routing Policies used during compliance testing.

Select : All, None

9.

Add Dial Patterns

Dial Patterns define digit strings to be matched against dialed numbers for directing calls to the appropriate SIP Entities. 5-digit extensions beginning with “5” resided on Communication Manager at Site 2. 5-digit extensions matching “20000” or “65000” were routed to the local Communication Manager for onward routing to Site 1. 5-digit extensions beginning with “75” were routed to the XMediusFAX fax server. Therefore 4 Dial Patterns were created accordingly.

Navigate to **Routing→Dial Patterns**, click the **New** button (not shown) to add a new Dial Pattern.

Under **General**:

- **Pattern**: dialed number or prefix
- **Min**: minimum length of dialed number
- **Max**: maximum length of dialed number
- **SIP Domain**: select the SIP Domain created in **Step 2** (or select **–ALL–** to be less restrictive)
- **Notes**: optional descriptive text

Under **Originating Locations and Routing Policies**

Click **Add** to select the appropriate originating Location and Routing Policy from the list (not shown).

Under **Time of Day**

Click **Add** to select the time range configured in **Step 7**.

Default settings can be used for the remaining fields. Click **Commit** to save the configuration.

Add Dial Patterns (continued)

The screens below shows the configuration details for the Dialed Patterns defined for routing calls to Communication Manager at the main enterprise site.

The screenshot displays the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura™ System Manager 6.1", and utility links for "Help | About | Change Password | Log off admin". The breadcrumb trail is "Home / Elements / Routing / Dial Patterns - Dial Pattern Details".

The main content area is titled "Dial Pattern Details" and includes "Commit" and "Cancel" buttons. The "General" section contains the following fields:

- * Pattern: 5
- * Min: 5
- * Max: 5
- Emergency Call:
- SIP Domain: avaya.com
- Notes: to CM_21_41

The "Originating Locations and Routing Policies" section features "Add" and "Remove" buttons. Below this is a table with 1 item and a "Refresh" button. The table has a "Filter: Enable" option.

<input type="checkbox"/>	Originating Location Name 1 ▲	Originating Location Notes	Routing Policy Name	Rank 2 ▲	Routing Policy Disabled	Routing Policy Destination	Routing Policy Notes
<input type="checkbox"/>	-ALL-	Any Locations	to CM_21_41	0	<input type="checkbox"/>	CM_21_41	

Below the table, there is a "Select : All, None" option.

The "Denied Originating Locations" section is visible at the bottom of the page.

Add Dial Patterns (continued)

The screen below shows the configuration details for the Dialed Pattern defined for routing calls to the XMediusFAX fax server.

The screenshot displays the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura® System Manager 6.1", and links for "Help | About | Change Password | Log off admin". A breadcrumb trail shows "Home / Elements / Routing / Dial Patterns - Dial Pattern Details".

The main content area is titled "Dial Pattern Details" and includes a "General" section with the following fields:

- * Pattern: 75
- * Min: 5
- * Max: 5
- Emergency Call:
- SIP Domain: avaya.com
- Notes: to local Fax Server

Below the general section is the "Originating Locations and Routing Policies" section, which contains a table with one item:

<input type="checkbox"/>	Originating Location Name ¹	Originating Location Notes	Routing Policy Name	Rank ²	Routing Policy Disabled	Routing Policy Destination	Routing Policy Notes
<input type="checkbox"/>	-ALL-	Any Locations	Local Fax Server	0	<input type="checkbox"/>	Fax Server	

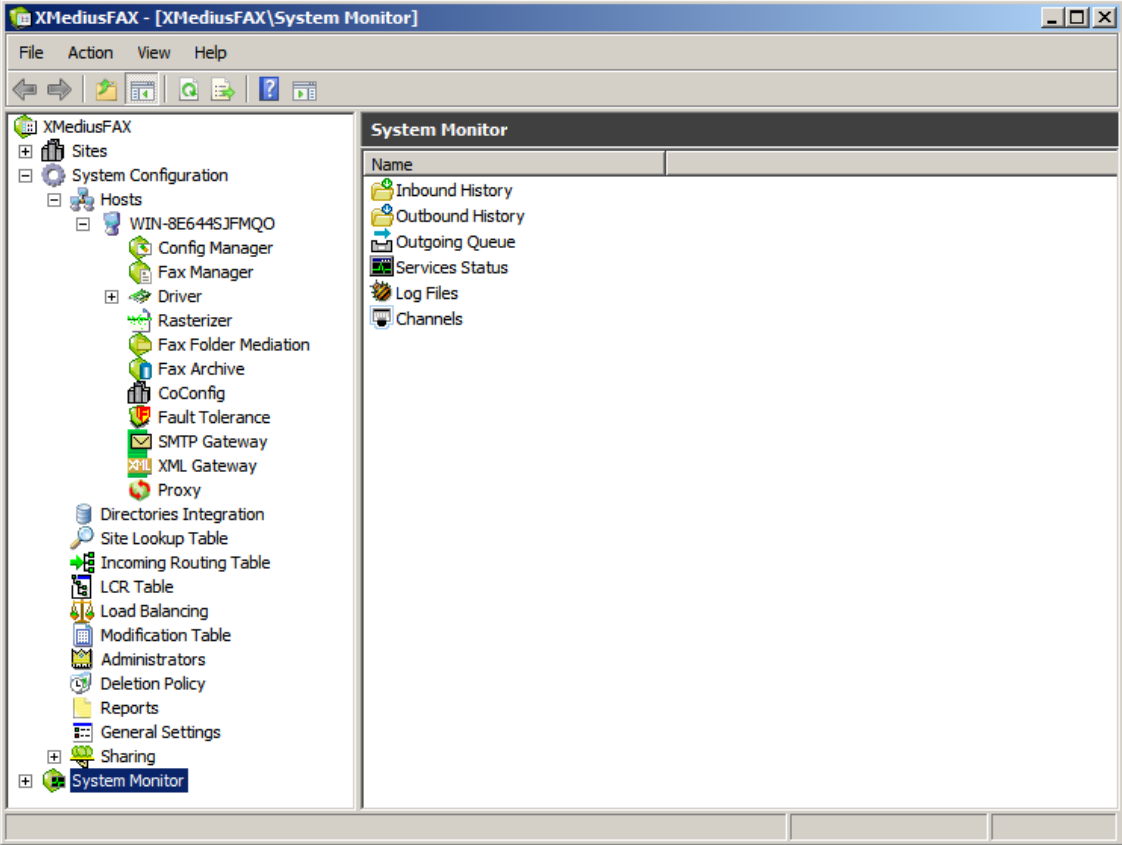

At the bottom of the page, there is a "Denied Originating Locations" section, which is currently empty (0 items). A "* Input Required" message is visible at the bottom left, and "Commit" and "Cancel" buttons are at the bottom right.

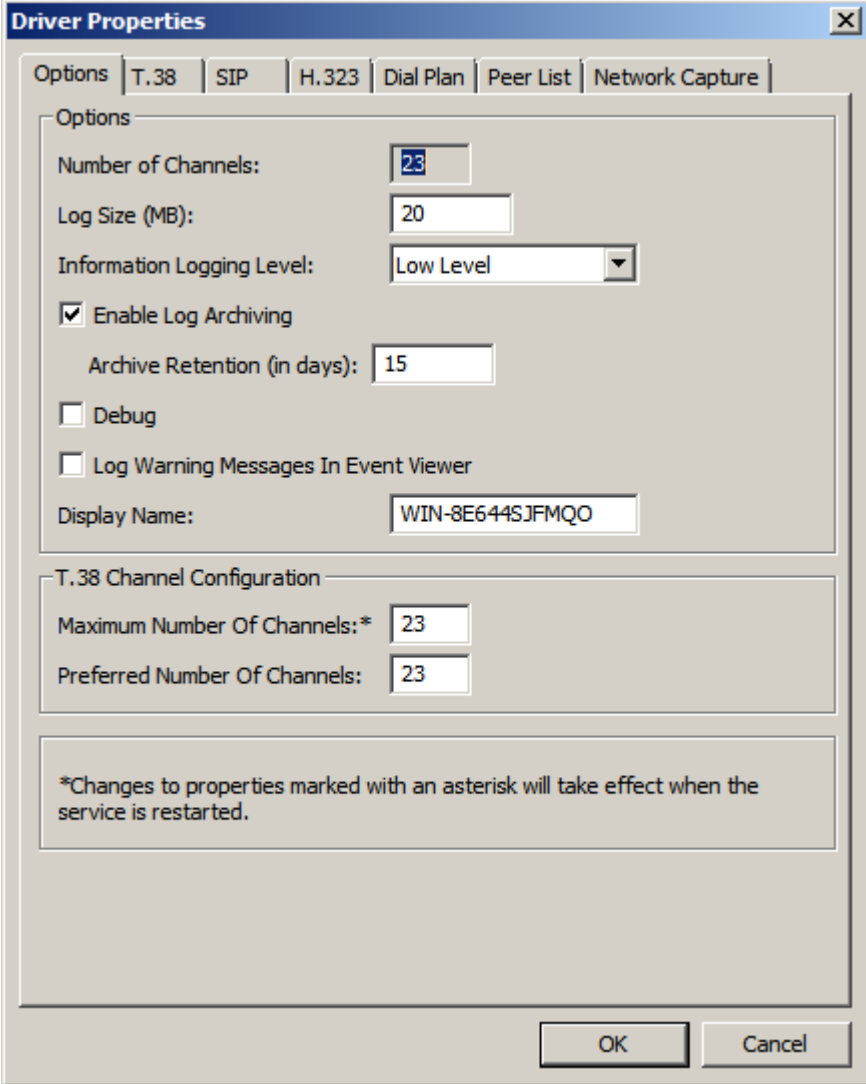

7. Configure Sagemcom XMediusFAX

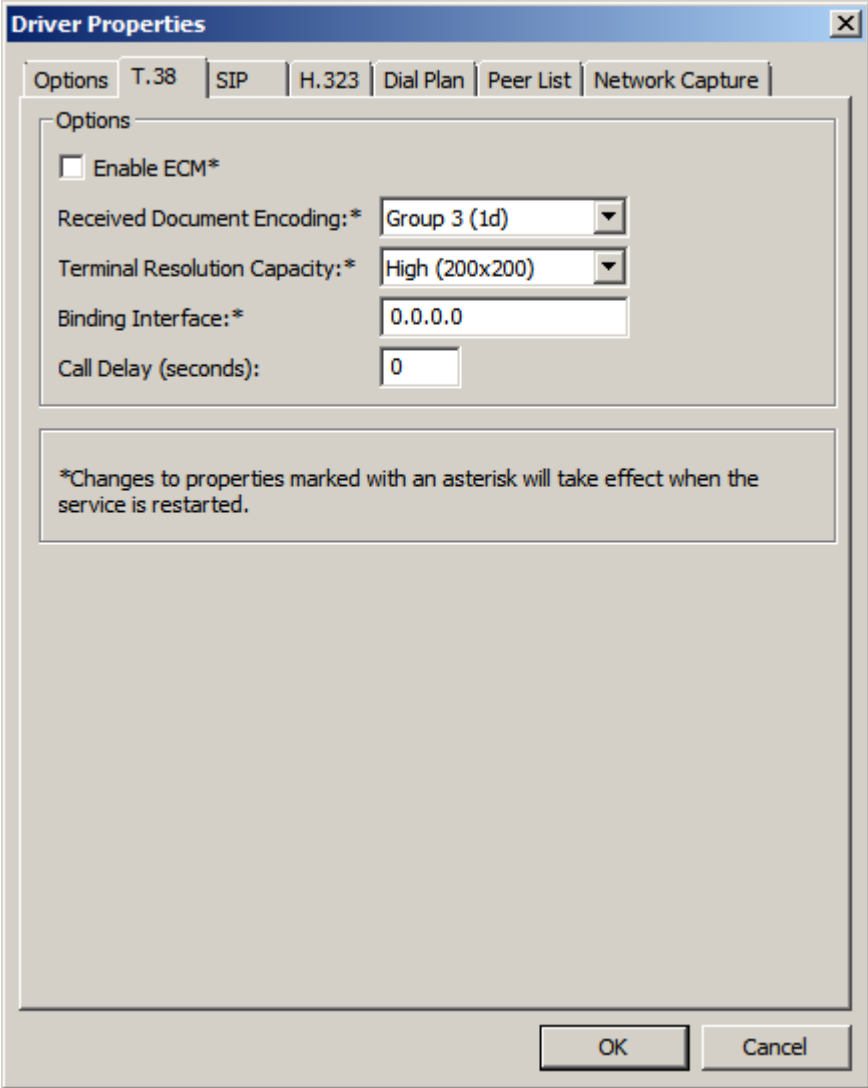

This section describes the configuration of XMediusFAX. It assumes that the application and all required software components have been installed and properly licensed. The number of channels supported by the XMediusFAX server is controlled via an XMediusFAX server license file. For instructions on sending and receiving faxes, consult the XMediusFAX Administrator Guide [5] and User Guide [7].

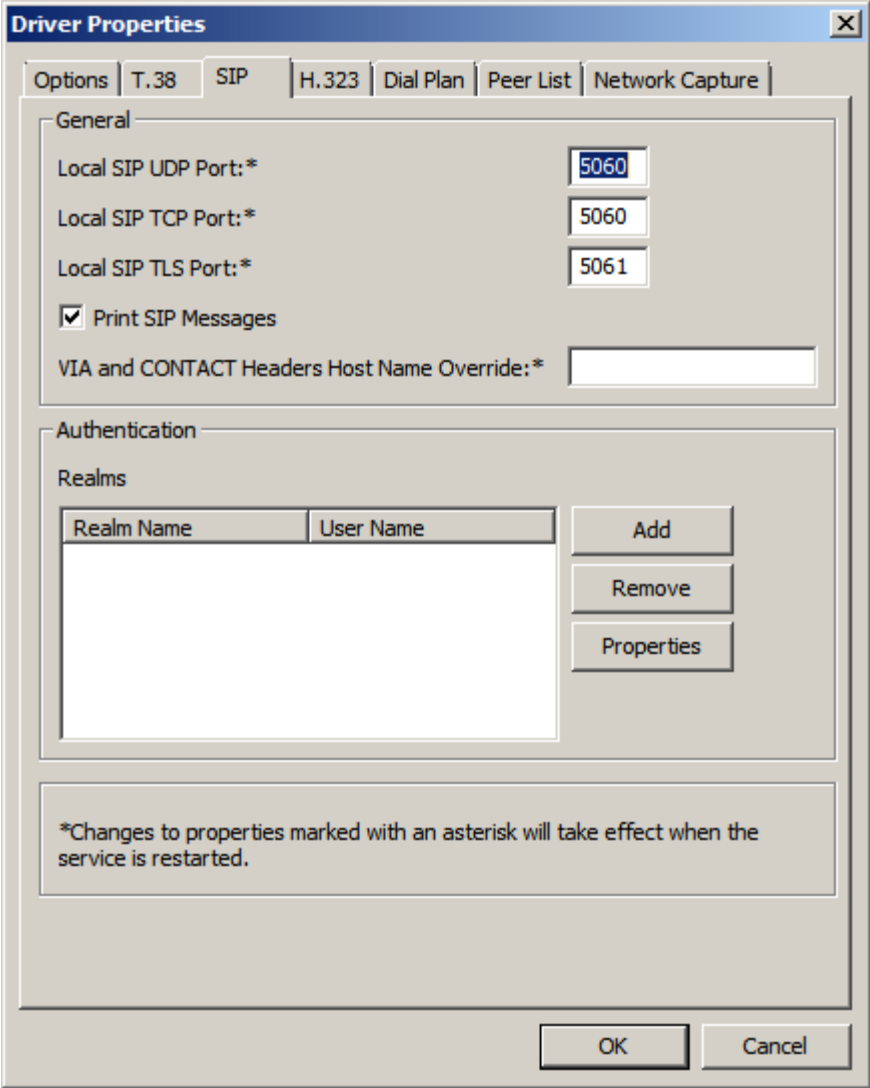

The examples shown in this section refer to Site 2. Unless specified otherwise, the same steps also apply to Site 1 using values appropriate for Site 1 from **Figure 1**.

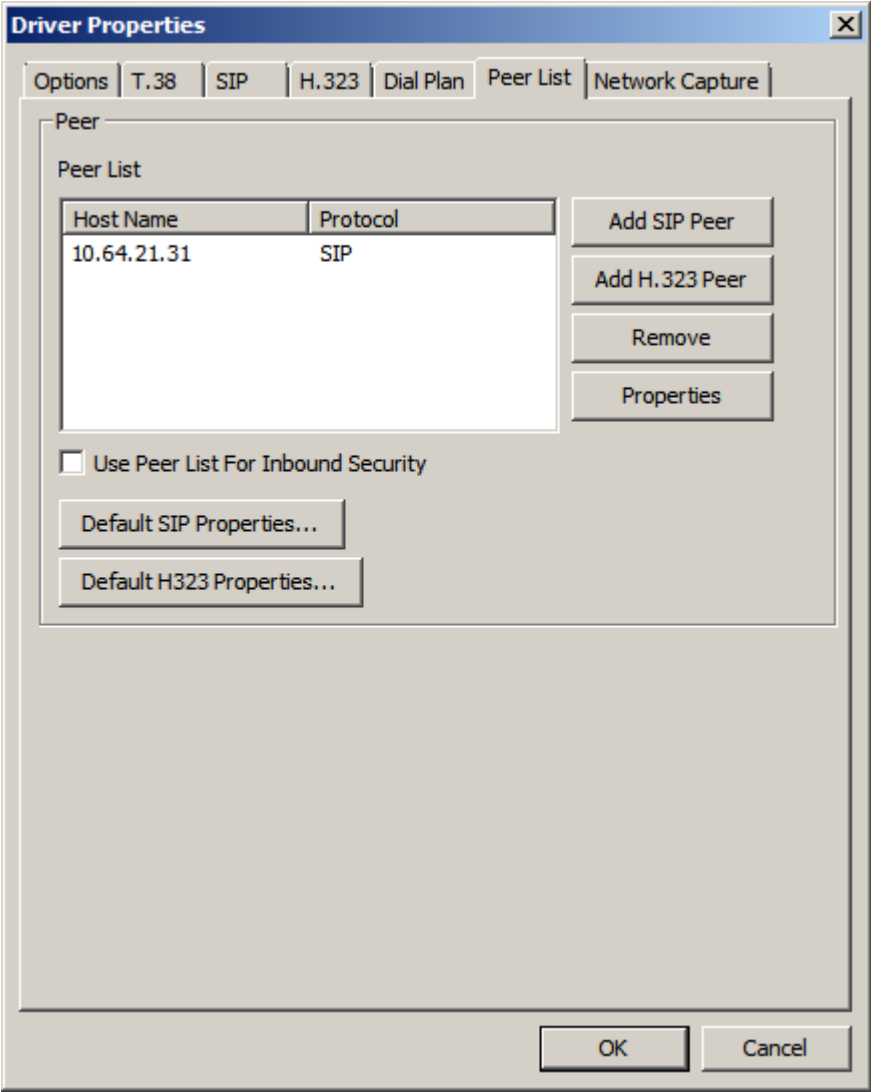

Step	Description
1.	<p>Prepare the fax server for launching the XMediusFAX software Consult Sagemcom for requirements and instructions.</p>
2.	<p>Launch the Application On the XMediusFAX server, launch the XMediusFAX application from the Windows Start Menu. Navigate to Start → All Programs → XMediusFAX → XMediusFAX. A login screen appears. Log in with proper credentials. Click the OK button.</p> <div data-bbox="592 940 1141 1472" data-label="Image"> </div>

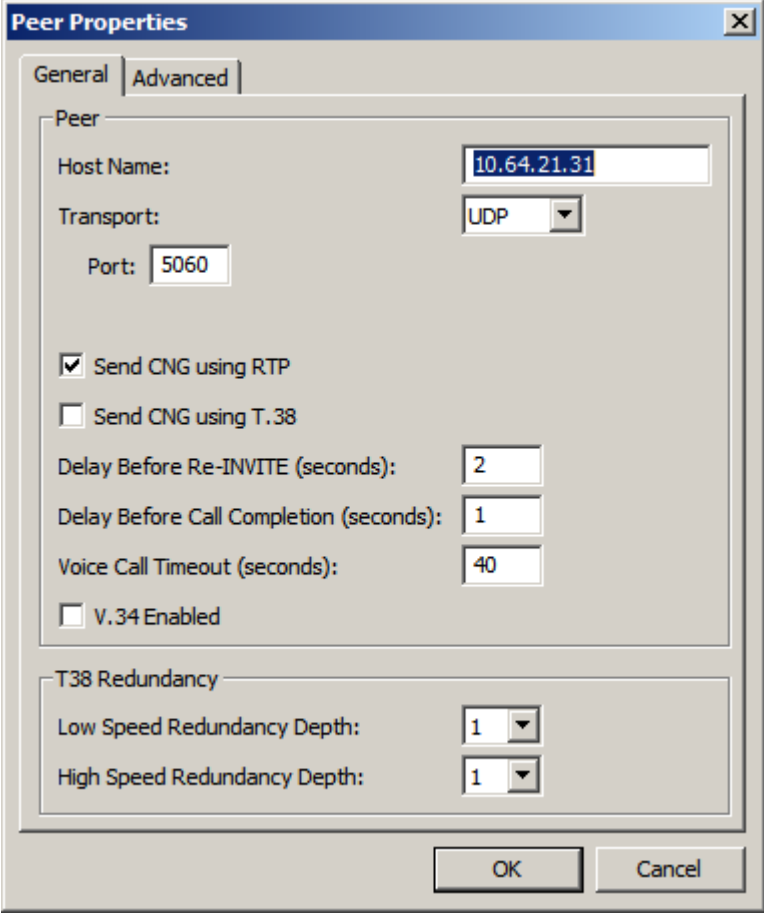

Step	Description
3.	<p>Configure Driver Properties On the main screen, navigate to XMediusFAX → System Configuration → Hosts → WIN-8E644SJFMQO → Driver in the left hand tree menu. Right-click on Driver and select Properties (not shown).</p>
 <p>The screenshot displays the XMediusFAX System Monitor application. The left-hand tree view is expanded to show the 'Driver' component under the 'WIN-8E644SJFMQO' host. The right-hand pane, titled 'System Monitor', lists several system components: Inbound History, Outbound History, Outgoing Queue, Services Status, Log Files, and Channels.</p>	

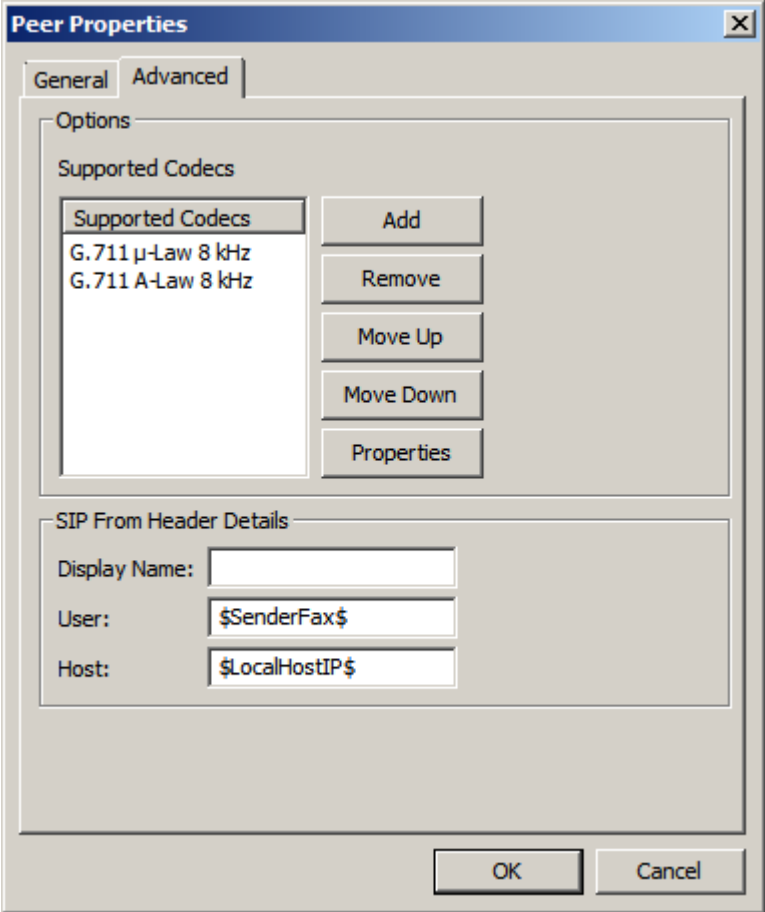

Step	Description
4.	<p data-bbox="305 233 532 264">General Options</p> <p data-bbox="305 268 1403 373">On the Driver Properties screen, select the Options tab. Set the Maximum Number Of Channels and Preferred Number Of Channels fields under T.38 Channel Configuration to the number of simultaneous faxes to be processed.</p> <div data-bbox="435 415 1295 1493" style="border: 1px solid gray; padding: 10px;">  <p>The screenshot shows the 'Driver Properties' dialog box with the 'Options' tab selected. Under the 'T.38 Channel Configuration' section, the 'Maximum Number Of Channels' and 'Preferred Number Of Channels' are both set to 23. Other settings include Log Size (20 MB), Information Logging Level (Low Level), and a checked 'Enable Log Archiving' option with a 15-day retention period.</p> </div>

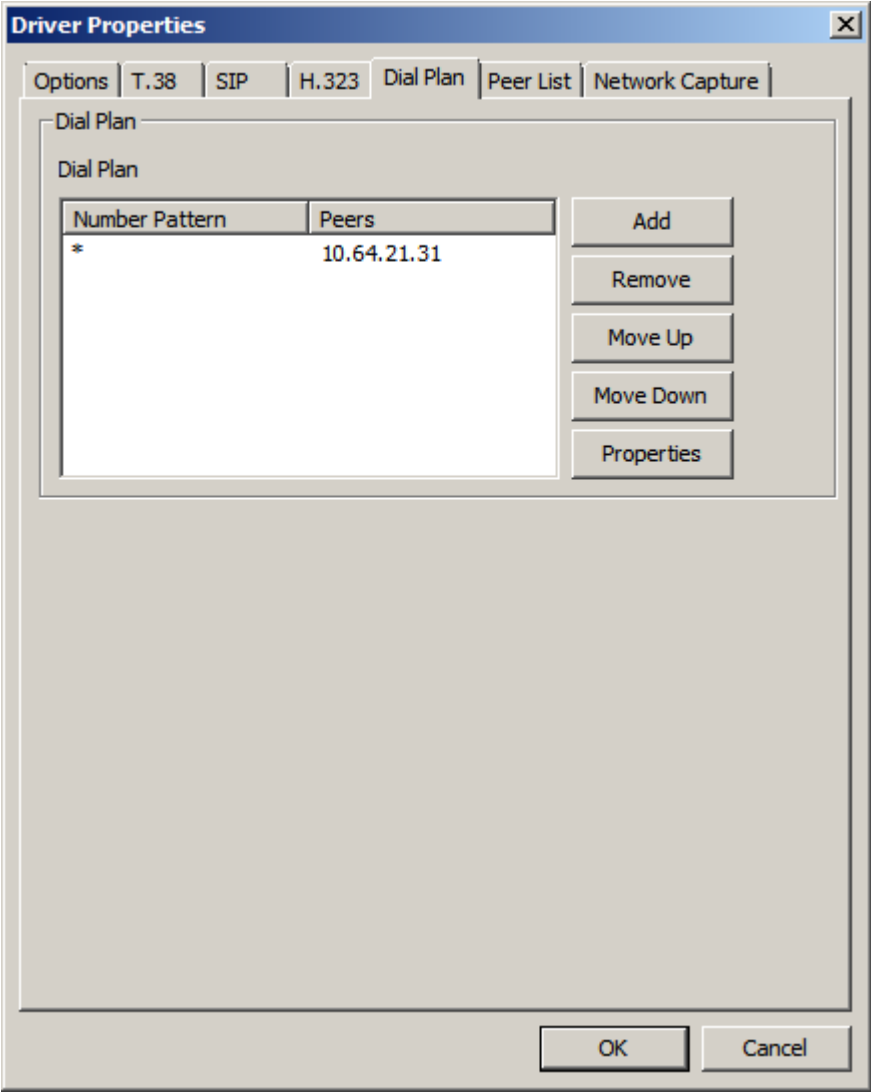

Step	Description
5.	<p>T.38 Parameters</p> <p>On the Driver Properties screen, select the T.38 tab. Configure the fields as follows:</p> <ul style="list-style-type: none"> • Received Document Encoding – Set this field to the highest encoding allowed. For the compliance test, this value was set to Group 3 (1d). • Terminal Resolution Capacity – Set this field to the highest resolution allowed desired. For the compliance test, this value was set to High (200x200). 

Step	Description
6.	<p>SIP Parameters</p> <p>On the Driver Properties screen, select the SIP tab. Configure the fields as follows:</p> <ul style="list-style-type: none"> • Local SIP UDP port – Set this field to match the first Port field in Section 6, Step 6. During compliance testing, UDP was used as the transport layer protocol by the XMediusFAX fax server. 

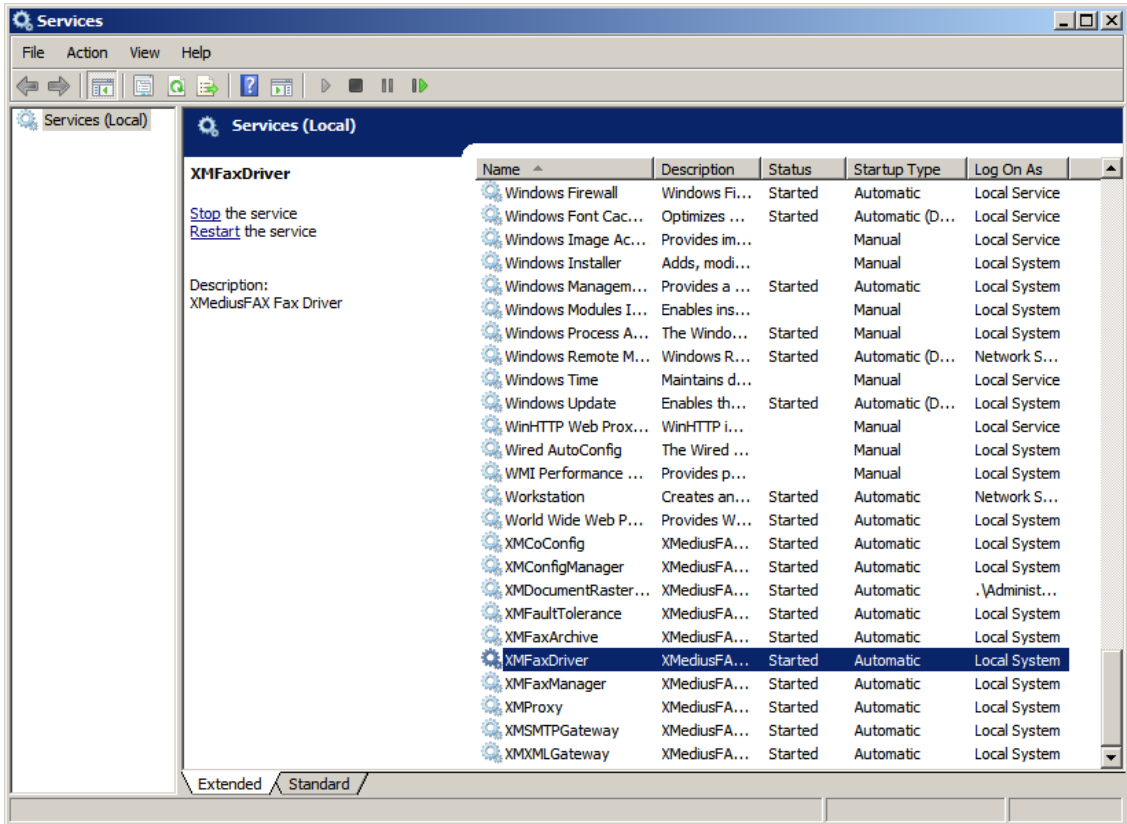

Step	Description				
7.	<p>Peer List</p> <p>On the Driver Properties screen, select the Peer List tab. To add a new SIP peer, select the Add SIP Peer button and enter the values shown in Step 8. To view an existing peer, highlight the peer in the list and click Properties. The example below shows the peer list after the Session Manager interface, 10.64.21.31, has been added to the list.</p>  <p>The screenshot shows the 'Driver Properties' dialog box with the 'Peer List' tab selected. The dialog has several tabs: Options, T.38, SIP, H.323, Dial Plan, Peer List, and Network Capture. The 'Peer List' tab contains a table with the following data:</p> <table border="1" data-bbox="493 680 987 911"> <thead> <tr> <th>Host Name</th> <th>Protocol</th> </tr> </thead> <tbody> <tr> <td>10.64.21.31</td> <td>SIP</td> </tr> </tbody> </table> <p>Below the table are several buttons: 'Add SIP Peer', 'Add H.323 Peer', 'Remove', and 'Properties'. There is also a checkbox for 'Use Peer List For Inbound Security' which is unchecked. At the bottom of the dialog are 'OK' and 'Cancel' buttons.</p>	Host Name	Protocol	10.64.21.31	SIP
Host Name	Protocol				
10.64.21.31	SIP				

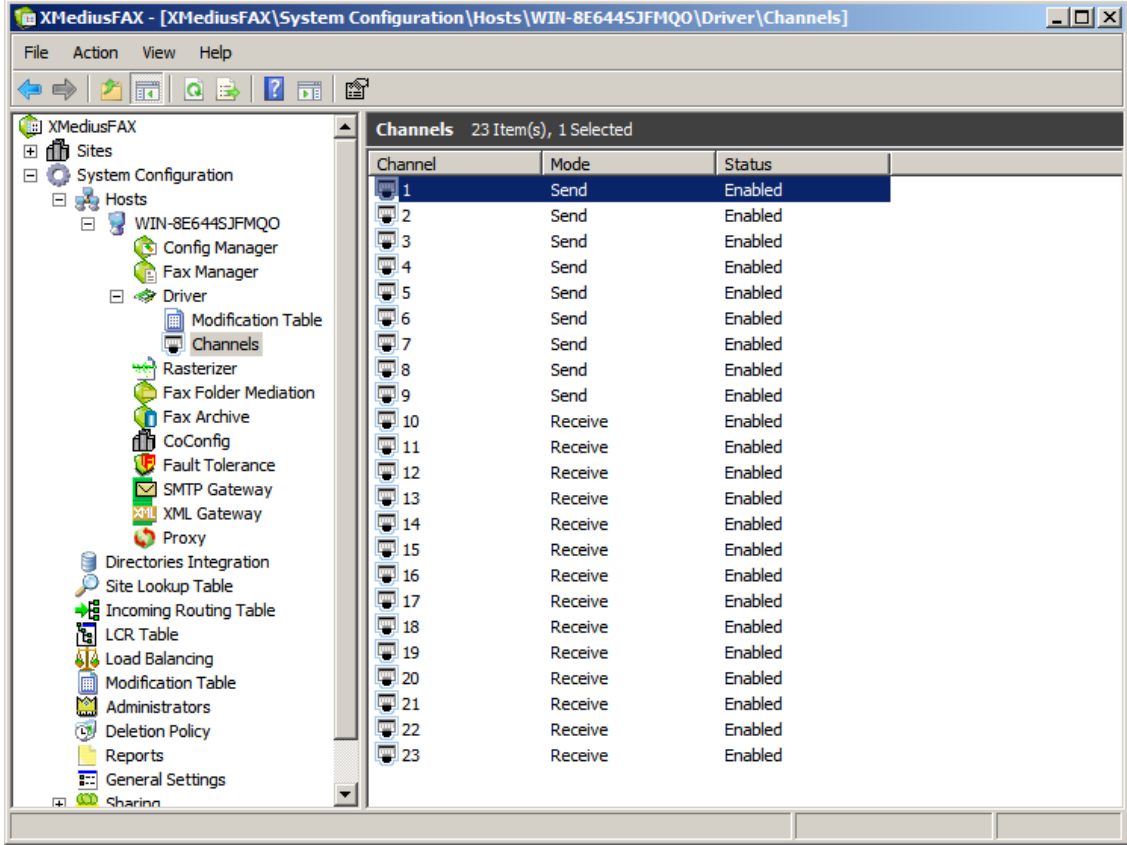

Step	Description
8.	<p>Peer Properties On the Peer Properties screen, configure as follows:</p> <ul style="list-style-type: none"> • Host Name – Set this field to the IP address of Session Manager. • Transport: Set this field to UDP. During compliance testing, UDP was used as the transport layer protocol by the XMediusFAX fax server. • Port - Set this field to 5060. • Check the Send CNG using RTP field. 

Step	Description
9.	<p>Codec</p> <p>On the Peer Properties screen, select the Advanced tab. To add a codec for the SIP peer, select the Add button and select the values from the drop-down menu. To view an existing codec, highlight the codec in the list and click Properties. The example below shows the codec list supported by the newly added SIP peer.</p> 

Step	Description
10.	<p>Dial Plan On the Driver Properties screen, select the Dial Plan tab. To add a new entry to the dial plan, select the Add button and enter the values shown in Step 11. To view an existing entry, highlight the entry in the list and click Properties to get the Number Pattern Properties screen. The example below shows the dial plan after the entry for * (any value) has been added to the list.</p> 

Step	Description				
11.	<p>Number Pattern Properties On the Number Pattern Properties screen, configure as follows:</p> <ul style="list-style-type: none"> • Number Pattern – Set this field to the pattern to match. In this example, the value of * indicates any dialed number is acceptable. • Peer – Click the Add button. In the Peer Properties window that appears (not shown), enter the Peer IP Address and Preference value of 1 and click OK. In this example, only one peer is configured. <div data-bbox="493 562 1240 1094" data-label="Image"> <table border="1" data-bbox="529 758 1026 993"> <thead> <tr> <th>Peer</th> <th>Preference</th> </tr> </thead> <tbody> <tr> <td>10.64.21.31</td> <td>1 (Higher)</td> </tr> </tbody> </table> </div> <p>Lastly, click OK on the Driver Properties screen shown in Step 10, to accept the Driver Configuration.</p>	Peer	Preference	10.64.21.31	1 (Higher)

8. Verification Steps

The following steps may be used to verify the configuration:

- Using System Manager, navigate to **Session Manager**→**System Status**→**SIP Entity Monitoring**, and click on the appropriate SIP Entities to verify that the Entity Link to Communication Manager is up.
- From the Communication Manager SAT, use the **status signaling-group x** command to verify that the SIP signaling group is in-service (where **x** is the signaling group number associated with the trunk between Communication Manager and Session Manager).
- From the Communication Manager SAT, use the **status trunk-group y** command to verify that the SIP trunk group is in-service (where **y** is the trunk group number for the trunk between Communication Manager and Session Manager).
- Verify that fax calls can be placed to/from the XMediusFAX fax server at each site.
- From the Avaya Communication Manager SAT, use the **list trace tac** command to verify that fax calls are routed over the expected trunks.

9. Conclusion

Sagemcom XMediusFAX passed compliance testing. These Application Notes describe the procedures required to configure Sagemcom XMediusFAX to interoperate with Session Manager and Communication Manager to support the network shown in **Figure 1**.
