Mega-Post PCI-Diagnostic Card

User's Guide

INTRODUCTION

The Mega-Post PCI-Diagnostic Card is a powerful diagnostic tool for technicians and administrators to

troubleshoot various problems of IBM compatible PCs. It is easy to install, yet extremely powerful to use. With

Diagnostic Card in hand, you no longer have to go through tedious and time consuming process of

trying to figure out what is wrong with your PC hardware. The Mega-Post PCI-Diagnostic Card will tell you

exactly what is wrong with your PC in just seconds. It saves you time and money.

Our new and improved design of the Mega-Post PCI-Diagnostic Card can work with almost all

popular types of CPUs, Motherboards, and BIOSes..

Trademarks

The Mega-Post PCI-Diagnostic Card is a trademark of Handelsvertretung Ellerhorst with all rights reserved.
IBM PC, PCjr, IBM PC XT, IBM AT, and PS/2 are trademarks of international Business Machines Co., Inc.
Pentium is a trademark of Intel Corporation.

System Requirements

The Mega-Post PCI-Diagnostic Card itself only requires an empty PCI or ISA expansion slot. It is not necessary
to install memory chips to perform analysis. "POST Codes" can be displayed through the hexadecimal display
panel on the Diagnostic Card itself.

Mega-Post PCI-Diagnostic Card Indicators

'Indicators' are any light emitting diodes(LED) or hexadecimal display panel that may be

mounted on an Diagnostic Card. This section discusses the following indicators that appear on the Mega-Post

PCI-Diagnostic Card:

- Dual POST Code Display
- PCI BUS SIGNALS LEDs

POST Code Display

The POST Code Display is made up of a dual, dot matrix hexadecimal read-out that displays
Power On Self Test (POST) status codes.

Power On Self-Test (POST) Codes

Most AT and 386 computers (and a few XT computers) output status codes during POST. The Diagnostic Card displays these codes during and after POST. Refer to Appendix A for a comprehensive listing of POST codes provided by BIOS manufacturers.

PCI Signal Definition:

CLK	**Motherboard Clock Signal.** Should be on when power is supplied to the motherboard even without CPU.
BIOS	**BIOS Read Signal.** Flashes when CPU reads BIOS code.
IRDY	**Device Ready.** Flashes when an IRDY signal is detected.
OSC	**ISA Oscillation Indicator.** Indicate ISA Oscillation Signal is available.
FRAME	**PCI Bus Frame**. Should be on under normal circumstances and flashes when a PCI Frame Signal is detected.
RST	**Reset.** After power on or reset, this indicator should be on for an half second and then turned off.
12V	**Power Supply, 12-Volt Positive.** Should be on all the time otherwise there is a short circuit.
-12V	**Power Supply, 12-Volt Negative.** Should be on all the time otherwise there is a short circuit.
5V	**Power Supply, 5-Volt Positive.** Should be on all the time otherwise there is a short circuit.
-5V	**Power Supply, 5-Volt Negative.** Should be on all the time otherwise there is a short circuit.
3V3	**Power Supply, 3.3-Volt.** Some motherboards have 3.3V power supply to PCI slots. This indicator should be on if the motherboard supplies 3.3V power.

Installing the Mega-Post PCI-Diagnostic Card

Installation Procedure

TO INSTALL A Diagnostic Card:

1) Install the Diagnostic Card in any available PCI or ISA expansion slot.
2) Connect the second display by flat cable
3) Connect the build-in speaker and motherboard with speaker cable
4) Power on the machine.

3

POST Codes

When the machine is turned on, the hexadecimal display should show the various POST codes as the system executes (unless it has a rare BIOS that does not display POST codes).

If the machine does not boot, system POST has detected a fatal fault and stopped. The number showing in the hexadecimal display on the Diagnostic Card is the number of the test in which POST failed. Refer to Appendix A for a listing of POST codes.

Troubleshooting During POST

After initial power up, Power-On Self-Test (POST) codes begin displaying on the Diagnostic Card's hexadecimal displays (for most machines).

> NOTE: *A few machines use the parallel port to display POST codes instead of the Diagnostic Card.*

THE POST PROCESS

The ROM built onto the motherboard of the computer rums its built-in POST (Power-On Self-Test) when you switch power on to the computer, press the reset button on the computer, or press Ctrl-Alt-Del (warm boot). POST performs a tightly interwoven initialization and testing process for each of these methods, but it typically does not test or initialize memory above 64K for warm boot. You can get an even better idea of the detailed process by studying the POST code listings in Appendix A.
