REPRODUCTION AUTOLITE BATTERIES

Autolite batteries are an excellent reproduction for your '65-'72 Mustang. Case is original type with proper lettering. Case also includes original "tabs" for proper mounting on early batteries. Batteries include state-of-the-art "guts" for easy starting. Group 24 only currently available. Shipped dry (you will need to find a local source for Electrolite). L10.75" W/Tab x W6.75" x H9".

- 65-72 .. AUT-B101 500 Cold cranking amps ... 99.00
- 65-72 .. AUT-B102 650 Cold cranking amps . 129.95

AUTOLITE BATTERY COVER **NEW!**

Give your car the original look, with the use of any 24F60 flat top maintenance free battery with the correct post location. Easy to install, just follow the instructions.

- A1 65-72 .. AUT-C101 Cover & Tag 44.95

OPTIMA BATTERY

Optima is a sealed, zero-maintenance battery that last longer, recharges faster, more dependable than any battery on the market. It can't even leak, so it can be shipped UPS ready to go! L9.94" x W6.75" x H7.81"

- B1 65-73 .. 800S 800 Cold cranking amps . 139.95

BATTERY CABLE BRACKETS & GROMMETS

- C1 65-66 .. C5ZZ-14302KR Bracket with Grommets ... pr.9.95
- 65-66 .. STARTER GROMMET Grommet only 1.99

MOTORCRAFT BATTERY CABLES

These cables give you the 60's look with 90's Performance.

- 65-68 .. 64-GRW Engine to firewall 6.95
- 65-73 .. 7164 Solenoid to Starter 14.95
- 65-73 .. 7304 Ground Cable 16.95
- 65-73 .. 7364 Battery to Solenoid 14.95

DIAMONDBACK SHIELDED BATTERY CABLES

Braided alloy shielding gives you the great "Braided" look and resists heat and abrasion. Heavy duty 4 gauge cable with Solid brass terminals - 3 times more conductive than lead.

- 65-73 .. 20142 Solenoid to Starter 13.95
- 65-73 .. 20038 Ground Cable 15.99
- E1 65-73 .. 20012 Battery to Solenoid 11.99

YOUR MUSTANG'S ELECTRICAL SYSTEM

Like most cars, your Mustang's electrical system consists of a "primary" and "secondary" system. The "primary" system is everything related to the engine's starting and ignition system. The "secondary" system consists of all wiring for headlights, taillights, and interior lights. Refer to the wiring diagram books that we sell. Also, pick up a (Repro) Shop Manual . After studying the schematics for some time, you'll easily understand how everything works. We have grouped this section by specific areas (starting, charging, interior, headlights, taillights and wiring looms), to help you find what you may need.

Note: 12 volt negative ground means that your Mustang's frame and metal body is the negative side of the electrical system. The wiring in your car carries the positive side to lights, etc.

BATTERY HINTS

When replacing the battery, wear safety goggles, and make sure the ignition is in the "off" position. Keep flame and sparks away. When picking up the battery, avoid pressing on sides, as it may force gas and/or acid from the top. Replace clean cable ends, before installing your new battery. Be sure cables are properly oriented

positive (+) and negative (-). On '64-'73 Mustangs, the positive cable is mounted between the positive battery terminal and solenoid, and is usually shorter. The negative cable goes from the battery (neg) to the engine block (ground).

Note: Most "dead" batteries that fail to start on a cold morning, many times is actually because of dirty battery terminals and cable ends.

HOW DO I KNOW MY IGNITION SWITCH IS BAD?

If your ignition switch fails to engage the starter, it may be bad. After hundreds of starts, this switch can wear down by dirty or worn contacts. A bad switch can also cause the solenoid and starter to "stick on", and also fail to engage the accessories contact.

ALTERNATOR TROUBLESHOOTING

The alternator is the one part that tells you when it's going bad. When the light on the dash (ALT) comes on, or flickers, it usually means that one (or both) of the two diodes in the alternator has failed, and it's time for a new or rebuilt one. If you're unsure, a local shop can run an electrical test on the alternator, voltage regulator and battery. Sometimes a low engine idle, and/or loose belt can make the "ALT" light flicker. When an alternator fails it usually takes the voltage regulator along with it. So it's highly advisable to replace both. If you drive your Mustang a lot, we recommend a state-of-art Motorcraft Voltage Regulator No. GR-540-A ('65-'73). For '67-'70 Shelybs and '68 California Specials, a higher amp alternator is recommended for those Cougar/T-Bird taillights. Use higher amp versions for air conditioning, too. Concours Restorers should rebuild their alternators with our kit instead of a rebuilt/exchange.

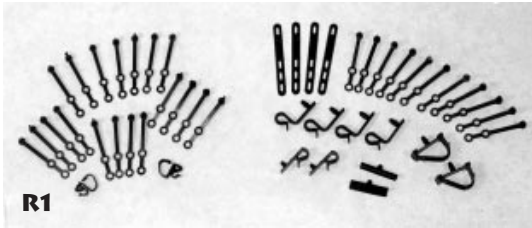

MUSTANG WIRING LOOMS AND HARNESSSES

Rewiring your Mustang, using reproduced looms and harnessses should not seem as difficult as at first impression.

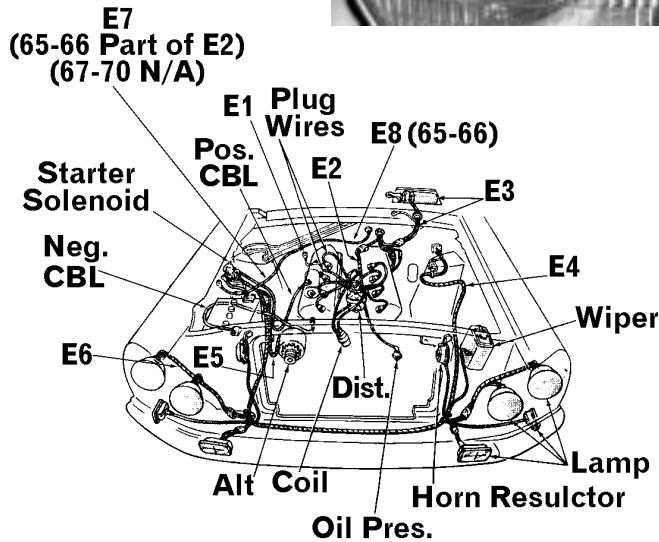

Your Mustang is basically made up of an under-dash harness with two attached "looms." These looms include the firewall to headlamp and dash to taillight. From the firewall to headlamp loom is attached the alternator to voltage regulator loom. Courtesy lights (roof) come off the taillight loom. The under-dash harness includes many plugs for the headlight, turn signal and wiper switches. The cigar lighter, radio, courtesy lights, dash lights, tach, etc., also go through the under-dash harness. If you're thoroughly confused by now, get a copy of the Wiring Diagrams Book.

If you are unsure about wiring your car, an auto electric shop can install your looms for you. Don't attempt wiring, splicing, etc., unless you know what you're doing, as an electrical fire can result from a "mistake."

HOW DO I KNOW IF MY HEADLIGHT SWITCH IS BAD?

If your headlights dim or flicker, or if your dash and/or taillights flicker, then the switch is bad. Circuit breakers are in the switch, and after much use, can fail. Remember to depress button on side of switch to remove switch handle (pulls out).

**Ground Screw****WHY WON'T MY TAILLIGHTS WORK?**

Few things are as frustrating as taillights that won't work. After years of use, old Mustang taillights can "go dark." Several things can hinder taillights, brake and signal lights. Two circuits go to every tail lights: brake/signal, and headlight/taillight. Both of these circuits go into one bulb (LH, RH each) with two filaments (No. 1157). A common ground wire or contact completes these circuits. The ground contact, usually the bulb socket against the reflector housing, (which is grounded to the car) can become corroded over the years and should be cleaned up or replaced.

A bad headlight switch can prevent the taillight circuit to work. If only one side works (taillight or signal or brake), then the turn signal switch is usually at fault. Check the brake light switch is well.

Taillights that work, but are dim, are usually due to a bad ground and/or taillight lenses that have darkened with age. Remember to do a complete restoration of the entire system to obtain optimum results. A voltmeter to measure amperage can be handy, too.

TAIL LIGHT - WIRE LOOM (A1)

Plugs into main under dash harness and turn signal harness and runs to tail lights, license plate light, back up lights, gas tank sending unit, and panel lamps on FB.

HOW DO I KNOW MY BRAKE (STOP) LIGHT SWITCH IS BAD?

If it isn't a bad turn signal switch, the brake light switch, mounted on the brake pedal (except '64-1/2), can either produce a dim, delayed or no brake signal, when bad. A good switch will produce brake lights at the slightest touch of the brakes. Replacement is relatively easy, if you're good at lying on your back under the dash!

Tech Tip HOW DO I KNOW MY TURN SIGNAL SWITCH IS BAD?
 If you've eliminated the possibility of turn signal & brake light bulb, pig tail, battery, or alternator etc., failure, then it probably is a bad switch. All four turn signals, the brake lights, license plate light, horn, as well as the emergency flasher (after '67), go through this switch. Four separate signals go through this switch, two front, two rear. You will need to pull the steering wheel to replace this switch, and rewire the connector to the under dash harness. (See Shop Manual). Do not over torque steering wheel after replacement, as it can break the plastic cam.

HOW DO I KNOW THE NEUTRAL SAFETY SWITCH IS OUT?

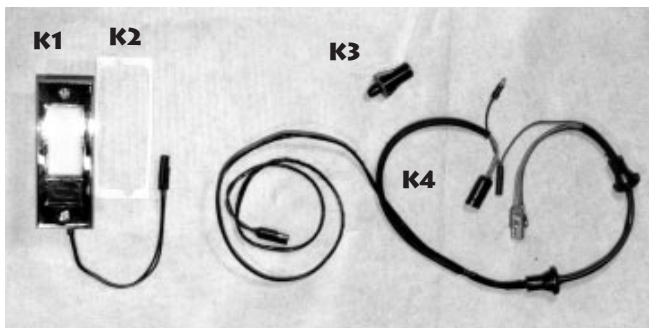

This switch, mounted on the side of the automatic transmission, is intended to prevent your starting in drive or reverse. If you turn the key and nothing happens - no starter movement - then with the brake on, shift into neutral and try. If it starts, the switch is out of adjustment, if not, chances are it's this switch (if the battery and starter and solenoid are o.k.). This switch can be replaced without removing the transmission.

RALLY-PAC

To add the "Grand Turismo" look, Ford added two gauges to the steering column, Tachometer and a Clock. Our reproduction includes an electronic Tach. and quartz clock. Authentic wrinkle finish. (1966 Type only, similar to '65 GT & Pony interior cars.
