Acknowledgment

This document was prepared by the GLS organization of the EN division of Lucent Technologies. Offices are located in Denver CO, Columbus OH, Middletown NJ, and Basking Ridge NJ, USA.

Trademarks

Lucent Technologies has made every effort to supply the following trademark information about company names, products, and services mentioned in the UCS 1000 R4.2 documentation library:

- Adobe Systems, Inc. — Trademarks: Adobe, Acrobat.
- Enhanced Software Technologies, Inc. — Trademark: Quickstart.
- Equinox Systems, Inc. — Registered trademark: Equinox
- Hewlett Packard Corporation — Registered trademarks: Hewlett-Packard and HP
- Intel Corporation — Registered trademarks: Pentium.
- International Business Machines Corporation — Registered trademarks: IBM, VTAM.
- Lucent Technologies — Registered trademarks: 4ESS, 5ESS, AUDIX, CONVERSANT, DEFINITY, Voice Power. Trademarks: FlexWord, Intuity, Lucent.
- Microsoft Corporation — Registered trademarks: Excel, Internet Explorer, Microsoft, MS, MS-DOS, Windows, Windows NT.
- Mylex Corporation — Registered trademark: Mylex.
- Novell, Inc. — Registered trademarks: Novell.

- Oracle Corporation — Trademarks: OBJECT*SQL, ORACLE, ORACLE*Terminal, PRO*C, SQL*FORMS, SQL*Menu, SQL*Net, SQL*Plus, SQL*ReportWriter.
- PCI Industrial Computer Manufacturers Group — Registered trademarks: CompactPCI and PICMG.
- Santa Cruz Operation, Inc. — Registered trademarks: UnixWare.
- Sun Microsystems — Registered trademarks: Sun, Sun Microsystems, Sun Workstation, Solaris (computer and peripherals). Trademarks: Solaris (operating system utilities) and Java
- UNIX System Laboratories, Inc. — Registered trademarks: UNIX.
- Xerox Corporation — Trademarks: Ethernet.

Limited Warranty

Lucent Technologies provides a limited warranty on this product. Refer to the “Limited Use Software License Agreement” card provided with your package.

Lucent Technologies has determined that use of this electronic data delivery system cannot cause harm to an end user's computing system and will not assume any responsibility for problems that may arise with a user's computer system while accessing the data in these documents.

Every effort has been made to make sure that this document is complete and accurate at the time of release, but information is subject to change.

**United States FCC
Compliance
Information**

Part 15: Class A statement. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

**Canadian
Department of
Communications
(DOC) Interference
Information**

This digital apparatus does not exceed the Class A limits for radio noise emissions set out in the radio interference regulations of the Canadian Department of Communications.

Le Présent Appareil Numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la class A prescrites dans le règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

Toll Fraud

Toll fraud is the unauthorized use of your telecommunications system by an unauthorized party, for example, persons other than your company's employees, agents, subcontractors, or persons working on your company's behalf. Note that there may be a risk of toll fraud associated with your telecommunications system and, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

Your Responsibility for Your System's Security

You and your system manager are responsible for the security of your system and for preventing unauthorized use. You are also responsible for reading all installation, instruction, and system administration documents provided with this product in order to fully understand the features that can introduce risk of toll fraud and the steps that can be taken to reduce that risk. Lucent Technologies does not warrant that this product is immune from or will prevent unauthorized use of common-carrier telecommunication services or facilities accessed through or connected to it. Lucent Technologies will not be responsible for any charges that result from such unauthorized use.

Lucent Technologies Fraud Intervention and Corporate Security

If you suspect that you are being victimized by toll fraud and you need technical support or assistance, call the Lucent Technologies National Customer Care Center Toll Fraud Intervention Hotline at 1 800 643-2353.

Aside from whether immediate support is required, all toll fraud incidents involving Lucent products or services should be reported to Lucent Corporate Security at 1 800 821-8235. In addition to recording the incident, Lucent Corporate Security is available for consultation on security issues, investigation support, referral to law enforcement agencies, and educational programs.

Glossary **627**

Index **699**

Overview

This document describes the procedures needed to perform full system administration for the following areas:

- The UNIX operating system
- The voice system
- Databases
- Switch interfaces

This document also describes the procedures needed to create and access system reports and to monitor the system.

Intended Audiences

The primary audience for this document are system administrators. This includes:

- On-site technicians who perform system administration at the customer site
- End customers who choose to administer their own systems

Secondary audiences include the field support personnel.

We assume that the primary users of this book have completed the UCS 1000 R4.2 hardware installation and maintenance training course. See [Using the CD-ROM Documentation on page xxxvi](#) for more information.

How This Book Is Organized

This document is designed to take you step by step through the system administration process. Each chapter contains procedures for a specific product area that requires administration.

Administration Procedures and Information

See [Chapter 1. Administration Overview](#), to familiarize yourself with the user interface and the system administration process including the user interface and the menus.

See [Chapter 2. UNIX Administration](#), for information about how to access the SYSADM menu and the procedures to perform basic UnixWare-level administration.

See [Chapter 3. Voice System Administration](#), for information about how to access the Voice System Administration menu and a description of all the administrative options. This chapter also contains the reference and procedural information for the Configuration Management option.

See [Chapter 4. Switch Interface Administration](#), for the procedures and reference information for administering the supported analog and digital switch interfaces.

See [Chapter 5. Database Administration](#), for the procedures and reference information for administering databases for use with the voice system.

See [Chapter 6. Peripheral Administration](#), for procedures and reference information for configuring and administering the peripheral equipment connected to your voice system, namely modems, printers, and remote terminals.

See [Chapter 7, Common Administration](#), for quick-reference information for some of the more common administrative tasks. Daily administration includes running system reports; performing common procedures such as system monitoring, media formatting, and backups; and administering the date and time.

Reference Material

See [Appendix A, Summary of Commands](#), for an alphabetical list of the commands in the UCS 1000 R4.2 command language.

See the Glossary for help in identifying and defining commonly used terms and acronyms.

To Locate Specific Topics

This book includes an alphabetical index at the end for quick access to specific topics.

Conventions Used in This Book

This section describes the typography and other conventions that are used in this book.

Note: The screens shown in this book are examples only. The screens you see on your system may be similar, but not exactly the same in all cases.

Terminology

- The word “type” means to press the key or sequence of keys specified. For example, an instruction to type the letter “y” is shown as
Type **y** to continue.
- The word “enter” means to type a value and then press the **ENTER** key on the keyboard. For example, an instruction to type the letter “y” and press **ENTER** is shown as
Enter **y** to continue.
- The word “select” means to move the cursor to the desired menu item and then press **ENTER**. For example, an instruction to move the cursor to the start test option on the Network Loop-Around Test screen and then press **ENTER** is shown as

Select:

```
> Start Test
```

- The system displays menus, screens, and windows. Menus ([Figure 1](#)) present options from which you can choose to view another menu, or a screen or window. Screens and windows both show ([Figure 2 on page xxviii](#) and [Figure 3 on page xxix](#)) and request ([Figure 4 on page xxix](#) and [Figure 5 on page xxx](#)) system information.

Figure 1. Example of a UCS 1000 R4.2 Menu

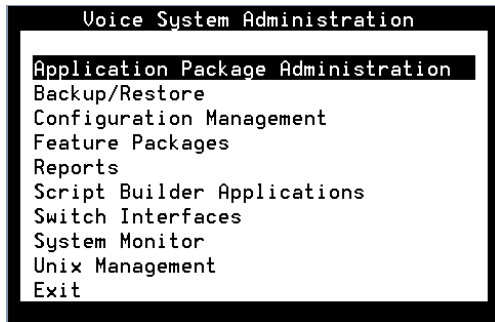

Figure 2. Example of a UCS 1000 R4.2 Screen Showing Information

```
UnixWare Installation           Primary Hard Disk Partitioning

In order to install LINCOS, you should reserve a UNIX system
partition (a portion of your hard disk's space) containing 100%
of the space on your primary hard disk. After you press 'ENTER'
you will be shown a screen that will allow you to create new
partitions, delete existing partitions or change the active
partition of your primary hard disk (the partition that your
computer will boot from).

WARNING: All files in any partition(s) you delete will be
destroyed. If you wish to attempt to preserve any files from an
existing UNIX system, do not delete its partitions(s).

The UNIX system partition that you intend to use on the primary
hard disk must be at least 4200 MBs and labeled "ACTIVE."

Press 'ENTER' to continue
```

Figure 3. Example of a UCS 1000 R4.2 Window Showing Information

```

Figure 4. Example of a UCS 1000 R4.2 Screen Requesting Information

```
UNIX System Installation Set Slice Sizes
Please select whether you would like the recommended slice
sizes or would like to customize the slice sizes.
Your choices are:
1. Recommended Slice Sizes
2. Customize Slice Sizes
Press '1' or '2' followed by 'ENTER': 1
```

Figure 5. Example of a UCS 1000 R4.2 Window Requesting Information

Keyboard and Telephone Keypad Representations

- Keys that you press on your terminal or PC are represented as capitalized **BOLD** text. For example, an instruction to press the Enter key is shown as
Press **ENTER**.
- Two or three keys that you press at the same time on your terminal or PC (that is, you hold down the first key while pressing the second and/or third key) are represented as a series of small, capitalized **BOLD** text separated by the plus sign (+). For example, an instruction to press and hold “Alt” while typing the letter “d” is shown as
Press **ALT+D**
- Function keys on your terminal, PC, or system screens, also known as soft keys, are represented as capitalized **BOLD** text followed by the function or value of that key enclosed in parentheses. For example, an instruction to press function key 2 is shown as
Press **F2 (Choices)**.

- Keys that you press on your telephone keypad are represented as **bold** text. For example, an instruction to press the first key on your telephone keypad is shown as

Press **1** to record a message.

Screen Displays

- System messages, field names, and prompts that appear on the screen are shown in `typewriter text`, as shown in the following examples:
 - ~ Enter the number of ports to be dedicated to outbound traffic in the `Maximum Simultaneous Ports` field.
 - ~ Enter **y** in the `Message Transfer?` field.
 - ~ The system displays the following message:
`Installation in progress.`
- The sequence of menu options that you must select to display a specific screen or submenu appears in a series of boxes.

Example:

Start at the Voice System Administration menu and select:

In this example, you would access the Voice System Administration menu and select the Reports menu. From the Reports menu, you would then select the Message Log Report window.

Some Screen Simulations

Text in a simulated screen display appears in typewriter text.

Example:

```
QuickStart - Data Recovery Rescue
Copyright(c) 1997-1999 by Enhanced Software Technologies, Inc.
Serial# 8200-999                               Version: 1.3.17

Backup System  Verify System  Recover System  Duplicate Diskette  Configure QuickStart  Exit and Reboot
```

Items That May or May Not Appear

Grayed-out type represents optional items that may or may not appear in a given display.

Example:

Once the backup is complete, the system displays a message similar to the following:

```
The Differential UNIX backup is now complete. Please remove
the tape and label it as "Differential UNIX Backup, created
August 30, 1999."
```

Other Typography

Command Text

- Literal values, commands, and text that you type in or enter appear in **bold type**, as in the following examples:

Example 1:

Enter **change-switch-time-zone** at the `Enter` command: prompt.

Example 2:

Type **high** or **low** in the `Speed:` field.

- Command variables are shown in **bold italic** type when they are part of what you must type in, and in italics when they are not part of the command line, for example:

Enter **ch ma *machine_name***, where *machine_name* is the name of the call delivery machine you just created.

- Command options are shown inside square brackets, for example:

Enter **connect *switchname* [-c] [-b | -w]**

Cross-References and Hypertext

[Blue, underlined](#) type indicates a cross reference or hypertext link that takes you to another location in the document when you click on it.

Safety and Security Alert Labels

This book uses the following symbols to call your attention to potential problems that could cause personal injury, damage to equipment, loss of data, service interruptions, or breaches of toll fraud security:

 **CAUTION:**

Indicates the presence of a hazard that if not avoided *can* or *will* cause minor personal injury or property damage, including loss of data.

 **WARNING:**

Indicates the presence of a hazard that if not avoided *can* cause death or severe personal injury.

 **DANGER:**

Indicates the presence of a hazard that if not avoided *will* cause death or severe personal injury.

 **SECURITY ALERT:**

Indicates the presence of a toll fraud security hazard. Toll fraud is the unauthorized use of a telecommunications system by an unauthorized party.

Related Resources

Updates to the Product

The following Web site displays any updates or exceptions to the product that have occurred after the publication of this document:

<http://glsdocs.lucent.com>

Training

For more information on UCS 1000 R4.2 training, call the BCS Education and Training Center at one of the following numbers:

- Organizations within Lucent Technologies (904) 636-3261
- Lucent Technologies customers and all others (800) 256-8988

Documentation

Appendix A, "Documentation Guide," in *UCS 1000 R4.2 System Description*, 585-313-209, provides an overview of all the books in the UCS 1000 R4.2 library that are mentioned in this book.

Additional Suggested Documentation

It is suggested that you also obtain and use the following book for information on security and toll fraud issues:

- *GBCS Products Security Handbook*, 555-025-600

Obtaining Printed Versions of the Documentation

See [Printing the Documentation on page xxxvii](#) for information on how to print this document.

You can also order the printed documents by calling 1-888-582-3688 or visiting the Customer Information Center (CIC) website at:

http://www.lucent.com/cgi-bin/CIC_store.cgi

Using the CD-ROM Documentation

Lucent Technologies ships the documentation in electronic form. Using the Adobe Acrobat Reader application, you can read these documents on a Windows PC, on a Sun Solaris workstation, or on an HP-UX workstation. Acrobat Reader displays high-quality, print-like graphics on both UNIX and Windows platforms. It provides scrolling, zoom, and extensive search capabilities, along with online help. A copy of Acrobat Reader is included with the documents.

Setting the Default Magnification

You can set your default magnification by selecting **File | Preferences | General**. We recommend the **Fit Page** option.

Adjusting the Window Size

On HP and Sun workstations, you can control the size of the reader window by using the **-geometry** argument. For example, the command string **acroread -geometry 900x900 mainmenu.pdf** opens the main menu with a window size of 900 pixels square.

Hiding and Displaying Bookmarks

By default, the document appears with bookmarks displayed on the left side of the screen. The bookmarks serve as a hypertext table of contents for the

chapter you are viewing. You can control the appearance of bookmarks by selecting **View | Page Only** or **View | Bookmarks and Page**.

Using the Button Bar

The button bar can take you to the book's Index, table of contents, main menu, and glossary. It also lets you update your documents. Click the corresponding button to jump to the section you want to read.

Using Hypertext Links

Hypertext-linked text appears in blue, italics, and underlined. These links are shortcuts to other sections or books.

Navigating with Double Arrow Keys

The double right and double left arrows ( and ) at the top of the Acrobat Reader window are the go-back and go-forward functions. The go-back button takes you to the last page you visited prior to the current page. Typically, you use  to jump back to the main text from a cross reference or illustration.

Searching for Topics

Acrobat has a sophisticated search capability. From the main menu, select **Tools | Search**. Then choose the **Master Index**.

Displaying Figures

If lines in figures appear broken or absent, increase the magnification. You might also want to print a paper copy of the figure for better resolution.

Printing the Documentation

Note: For information on ordering printed copies of the documents, see [Obtaining Printed Versions of the Documentation on page xxxv](#).

If you would want to read the documentation in paper form rather than on a computer monitor, you can print all or portions of the online screens.

Printing an Entire Document

To print an entire document:

- 1 From the documentation main menu screen, select one of the print-optimized documents. Print-optimized documents print two-screens to a side, both sides of the sheet on 8.5x11-in or A4 paper.
- 2 Select **File | Print**.
- 3 Enter the page range you want to print, or select **All**. Note that the print page range is different from the page numbers on the documents (they print two to a page).
- 4 After the document is printed, close the file. Do not leave this file open while viewing the electronic documents.

Printing Part of a Document

To print a single page or a short section, you can print directly from the online version of the document:

- 1 Select **File | Print**.
- 2 Enter the page range you want to print, or select **Current**.

The document is printed, one screen per side, two sides per sheet.

How to Comment on This Book

A comment card is included at the back of this book. While we have tried to make this document fit your needs, we are interested in your suggestions for improving it and urge you to complete and return a comment card to us. If the comment card has been removed from this book, send you comments to the address below. Be sure to include the name and document number of this book, *UCS 1000 R4.2 Administration*, 585-313-507.

Lucent Technologies
GLS Information Development Division
Room 22-2H15
11900 North Pecos Street
Denver, Colorado 80234-2703 US

You may also fax your comments to the attention of the Lucent Technologies UCS 1000 R4.2 writing team at (303) 538-1741.

1 Administration Overview

Overview

This chapter provides an overview of system administration and is designed to familiarize you with the UCS 1000 R4.2 user interface and the system administration process including:

- User interface overview
- User interface components
- The administration menus

User Interface Overview

A user interface is a method by which a computer user accesses the information on the computer. For example, Microsoft Windows is a graphical user interface (also known as GUI).

The UCS 1000 R4.2 user interface is menu-driven; that is, you select an option from a list to display another menu or window. You can display more than one menu or window concurrently, but only the last one displayed is

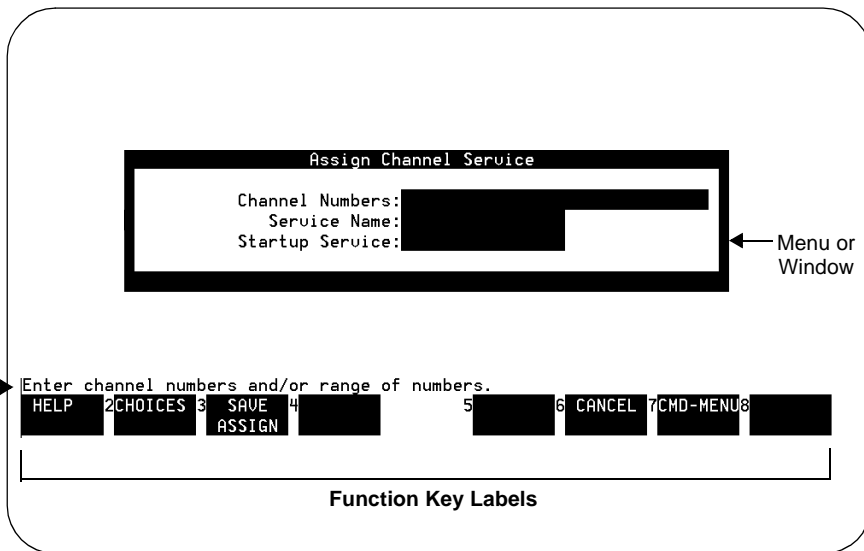

active. To return to the previous menu or window, you can cancel the active one.

UCS 1000 R4.2 User Interface

Administering the voice system through the administrative screens involves many activities, and all share a common user interface. Although the information on the screen changes often, the information arrangement does not change. The typical screen contents is as follows ([Figure 6 on page 3](#)):

- Menu and/or window
- Message line
- Function key labels

Figure 6. Sample UCS 1000 R4.2 System Screen

Cursor Movement Keys

[Table 1](#) lists the keys used to maneuver within a menu or window. They are referred to throughout this book as the cursor movement keys.

Table 1. Cursor Movement Keys

Type of Movement	Key
Move to next line in menu, list, or text; “wrap” from last item to first item in a menu or form	
Move to previous line in menu, list, or text; “wrap” from first item to last item in a menu or form	
Move down one “screenful”	PgDw
Move up one “screenful”	PgUp
Move to next field in a screen or window	Tab , or Enter
Move to previous field in a screen or window	Shift , or Tab
Move to next character within a field	
Move to previous character within a field	
Delete character to the left of the cursor	BackSpace

Menus and Windows

You use menus and windows to exchange information with the voice system. This exchange may involve activities such as making menu selections or populating fields. Since the display may contain more than one menu or window at the same time, each menu/window is outlined so that it is clear what information it contains. At any given time, only one menu or window on screen is designated as active.

Menus

A menu allows you to select an option that takes you to the next menu or window ([Figure 7](#)).

Figure 7. Sample Menu

The components of a menu include:

- Title — The title describes the information contained within the menu, or the tasks you can accomplish using it. In this book, titles are shown with the first letter of each word capitalized, followed by the word *menu*, such as the *Configuration Management menu*.
- Scroll Indicator — The scroll bar indicates whether there is additional text to be displayed. The  indicates there is more information to view below what is presently shown. The  indicates there is more information to view above what is currently displayed. Not every menu has a scroll indicator.

Selecting a Menu Item

To select a menu item, highlight it using one of the following methods and then press **Enter**:

- Use the cursor movement keys to move the highlight bar:
 - ~ Press  to move the highlight bar down.
 - ~ Press  to move the highlight bar up.

Menus have a “rollover” feature. When the cursor reaches the last item of the menu, press  to return to the first menu item. If the cursor is highlighting the first menu item, press  to move to the last menu item.

- Type the first character(s) of the menu line. The system highlights the first menu item beginning with that letter. For example, in [Figure 7 on page 5](#), type **S** to select `System Control`. If there is another menu item beginning with “s,” type more characters.

The menu items are not case-sensitive; that is, typing **A** is the same as typing **a**. If you type a letter for which there is no matching item, the system “beeps” and does not move the highlight bar.

Windows

A window allows you to enter and view information, and can range in size. See [Figure 8](#) and [Figure 9 on page 8](#).

Figure 8. Sample Window

Figure 9. Sample Window

The components of a window include:

- Title — The title describes the information contained within the window, or the tasks you can accomplish using it. In this book, titles are shown with the first letter of each word capitalized, followed by the word *window*, such as *Voice Equipment window*.
- Scroll Indicator — The scroll bar indicates whether there is additional text to be displayed. The  indicates there is more information to view below what is presently shown. The  indicates there is more information to view above what is currently displayed. Not every window has a scroll indicator.
- Fields — Fields are the areas on a window where you enter information. For example, in [Figure 6 on page 3](#) the fields are Channel Numbers, Service Name, and Startup Service. Use the **TAB** or **ENTER** keys to move through the fields in succession.

Menus do not have fields.

Populating Fields

There are three ways to enter information in a field, as described below.

- Type the first character or first few characters of the entry.

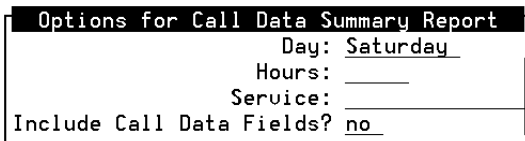

With the cursor positioned on the field, begin to type the entry. As soon as you type enough characters to uniquely identify the desired entry, the system automatically supplies the remaining characters. If the entry is invalid, the system beeps and removes the invalid characters.

For example, given the `Day:` field in [Figure 10 on page 10](#), assume that valid entries are the names of the days in the week. When you type **M**, the system fills in the entire word *Monday* because there is only one valid entry that begins with *M*.

However, if you type **S**, the system waits before filling in the day of the week because there are two valid entries that begin with *S* (Saturday and Sunday). At this point, if you type **a**, the system fills in the word *Saturday*. If you type **u**, the system fills in the word *Sunday*. This technique is not case-sensitive. In other words, typing either **M** or **m** in the above example results in the system filling in the word *Monday*.

- Press **F2** (Choices) for a list of valid entries for the particular field.

Figure 10. Fields in the Call Data Summary Report Window

```
Options for Call Data Summary Report
Day: Saturday
Hours: _____
Service: _____
Include Call Data Fields? no
```

- Type the entire entry.

Move to the desired field and type the entire entry. While in a field, you can also edit the entry.

- Use the CHOICES screen selections.

Press **F2** (Choices) to open a menu that shows the available choices for a field. Select an option as you would in a standard menu. The content of the CHOICES menu varies depending on the situation. Sometimes no CHOICES menu is available for a screen or window.

Message Line

The message line, if present on the screen, contains a brief instruction to help you decide what to do next. The message line also reports the successful or unsuccessful completion of a task.

Function Keys

Your keyboard has eight to twelve function keys. The system uses the first eight function keys, labeled **F1** through **F8**.

The boxed labels at the bottom of the display correspond to the function keys on your keyboard. Function keys are the means by which you command the system to perform a function within the active menu or window. The label describes the instruction that is sent to the system when you press the corresponding function key. The commands, and therefore the labels, that are available at any given time vary depending on the active menu or window. Menus and windows may have one or two rows of function key labels. See [Figure 11 on page 12](#) for an example of a window with function key labels.

In [Figure 11 on page 12](#) you press **F1** to access the Help screen for the System Monitor window. Also in [Figure 11 on page 12](#), notice that the label for **F4** is blank. This indicates that no command is issued if you press the **F4** function key. If you press an inactive function key, the system beeps and the message line either indicates an undefined function key or continues to display the last message. The function key labels displayed apply only to the active menu or window.

HELP

PREVPAGE

NEXTPAGE

CANCEL

CMD-MENU

CHG-KEYS

Standard Function Key Labels

Standard function key labels remain constant regardless of the active menu or window. They represent commands that are valid for every menu or window in the system. See [Table 2 on page 13](#) for a description of standard function key labels.

Table 2. Standard Function Key Labels

Key	Description
F1 Help	Opens an online help window. See Online Help on page 17 for more information about online help.
F6 Cancel	Closes the active screen and cancels any additions, deletions, or changes made. The screen that immediately precedes the just-closed screen becomes the active screen. If there is an activity in progress, such as making a backup copy of an application on a floppy disk, pressing F6 (CANCEL) does not interrupt the operation.
F7 Cmd-Menu	Opens the Command Menu. Options include System Monitor, Trace Service, and Exit. See Command Menu on page 297 in Chapter 7, Common Administration , for more information.

Optional Function Key Labels

The optional function key labels change based on the active menu or window, and provide commands that are unique to the menu or window. See [Table 3 on page 14](#) for a description of optional function key labels.

Table 3. Optional Function Key Labels

Function Key Label	Description
F2 (Choices)	Opens a menu screen containing choices for the current field, if there is a finite set of choices for a particular field. Move the cursor to the field you want to fill and press F2 (CHOICES). The CHOICES menu opens, displaying the options available for that field.
F2 (Prevpage)	Scrolls back one full page, towards the beginning of text that is too long to fit within the active screen or window.
F3 (Nextpage)	Scrolls forward, toward the end of text that is too long to fit within the active screen, menu, or window. For example, pressing F3 in Figure 11 on page 12 orders the system to move to the next page, while pressing F3 in Figure 12 on page 16 sounds a beep, but does nothing else because that key is “empty.”
F3 (Save)	Preserves all changes made to the screen.
F4 (Top)	Scrolls toward the top of a page.

1 of 2

Table 3. Optional Function Key Labels

Function Key Label	Description
F5 (Bottom)	Scrolls toward the bottom of a page.
F6 (Print)	Prints the information provided by the active screen, such as a report.
F7 (Frm-Mgmt)	Opens the Frame Management Menu. See Command Menu on page 297 in Chapter 7, Common Administration , for more information. Options include list, move, refresh, and UNIX system.
F8 Chg-Keys	Switches the function key labels displayed from standard to optional, or vice versa. For example, Figure 11 on page 12 and Figure 12 on page 16 show the System Monitor window. Figure 12 on page 16 displays the optional function key labels through the use of F8 (Chg-Keys) to switch between the standard (Figure 11 on page 12) and optional (Figure 12 on page 16) labels.

Note: In [Figure 12](#), the **Host Mon** function key selection does not appear if host software is not installed.

Online Help

Most screens and windows have a companion text window that contains helpful reference information. [Figure 13](#) shows the help screen associated with the Database Access ID Table window. The system online help windows are not designed to be a substitute for this book. They briefly describe each of your options for a given menu or window. Press **F1** to access online help.

Figure 13. Sample Online Help Screen, Database Access ID Table

Accessing the Administration Menus

To access the administration menu:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter one of the following commands at the prompt:

~ To display the administration menu, enter **cvis_mainmenu**

The system displays the administration menu ([Figure 14](#)).

Figure 14. Administration Menu

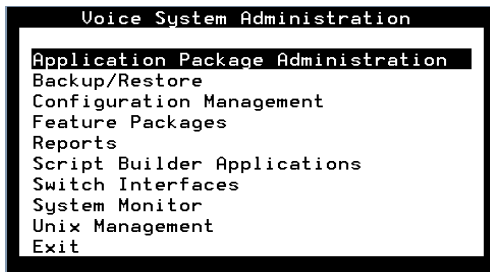

~ To display the Voice System Administration menu, enter **cvis_menu**

! CAUTION:

Do not create multiple simultaneous **cvis_menu** processes. This could severely impact performance and may lock up the system.

The system displays the Voice System Administration menu ([Figure 15](#)).

Figure 15. Voice System Administration Menu

See [Chapter 3. Voice System Administration](#), for more information and procedures on voice system administration.

Administration Menu Options

From the administration menu, you can initiate UNIX System Administration and Voice System Administration, or you may exit.

UNIX System Administration

From the UNIX System Administration menu, you can set up a variety of generic software operations including backups, printer operations, and peripheral setup. See [Chapter 2, UNIX Administration](#), for more information and procedures on UNIX administration.

Voice System Administration

From the Voice System Administration menu, you can begin your session for administering the system, such as application packages or reports. See [Chapter 3, Voice System Administration](#), for more information and procedures on voice system administration.

Exit

Exit takes you out of the administration menus and returns you to the UNIX system prompt.

Press **F6** (Cancel) from almost any place in the Administration menu structure to close the active window and return to the previous menu. If you press **F6** (Cancel) enough times, depending on how deep into the menus you are, you will eventually exit the menu structure completely and return to the operating system prompt.

Note: **F6** (Cancel) does not exit from the UNIX System Administration menus. See [Exit UNIX System Administration Menu on page 57](#) in [Chapter 2, UNIX Administration](#), for the procedure to exit from the UNIX System Administration menus.

2 UNIX Administration

Overview

This chapter describes the UnixWare™ system administration user interface, the procedures to access the UnixWare administration menu, and the procedures to perform basic UnixWare-level administration.

The sections in this chapter are arranged in the same order as the administration services in the UnixWare administration main menu.

UnixWare Documentation

For additional information on UnixWare administration, see the UnixWare documentation. Start with the *System Administration Volume 1* for an overview of the UnixWare system administration and for an introduction to administration concepts and procedures. Many of the procedures in this chapter reference other UnixWare system administration books. Follow the referenced procedures for additional information.

UNIX System Administration Access

To access SYSADM (the OA&M menu interface of UnixWare):

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cvis_mainmenu**

The system displays the Administration menu ([Figure 16](#)).

Figure 16. Administration Menu

4 Select:

```
> UNIX System Administration
```

The system displays the UNIX System V Administration menu ([Figure 17 on page 24](#)).

Figure 17. UNIX System V Administration Menu

```
UnixWare 2.1.3 Operations, Administration and Maintenance
```

```
1 UNIX System V Administration
```

```
>applications - Administration for Available Applications
backup_service - Backup Scheduling, Setup and Control
file_systems - File System Creation, Checking and Mounting
machine - Machine Configuration, Display and Shutdown
network_services - Network Services Administration
ports - Port Access Services and Monitors
printers - Printer Configuration and Services
restore_service - Restore From Backup Data
schedule_task - Schedule Automatic Task
security - Security Management
software - Software Installation and Removal
storage_devices - Storage Device Operations and Definitions
system_setup - System Name, Date/Time and Initial Password Setup
users - User Login and Group Administration
```

All of the procedures in this book assume that you are using the user interface menus. The procedures provide references to the books detailing command line interfaces when possible.

Application Administration

The Application Administration menu provides menus and tasks for administering custom applications. Application developers can use this option to place menus from which to administer add-on or custom applications.

Backup Scheduling, Setup and Control

The Backup Service menu provides two backup options: basic and extended. Back-up files can be stored on either tape or diskettes.

Note: Diskettes must be UNIX formatted when you begin this procedure. Tapes can be unformatted.

See “Backing Up the UCS 1000 R4.2 System” in Chapter 3, “Common System Procedures,” in *UCS 1000 R4.2 System Reference*, 585-313-210, for information on when to conduct backups.

The basic backup services allow you to:

- Display the date and time of the last system and incremental backup.
- Conduct a backup of all files or only selected files in your HOME directory.
- Add, change, delete, or display backup requests.
- Back up all system and user files that have been modified or created since your voice system was installed.

The extended backup services allow you to:

- Determine the backup rotation period.
- Specify how backups are to be done for file systems and data partitions.
- Display the backup history and backup status logs.
- Establish lists of files that should not be backed up.
- Respond to system prompts during backup jobs.
- Schedule backups and the reminder messages that backups should be done.

Note: If you want to back up and restore speech files, see the [spsav](#) command in [Appendix A, Summary of Commands](#).

To access backup services:

- 1 Start at the UNIX System V Administration menu ([Figure 17 on page 24](#)) and select:

```
> backup_service
```

The system displays the Backup Service Management menu ([Figure 18](#)).

Figure 18. Backup Service Management Menu

```
2 Backup Service Management
+basic - Basic Backup Service
extended - Extended Backup Service
```

Basic Backup

To perform a basic backup:

- 1 Start at the Backup Service Management menu ([Figure 18 on page 27](#)) and select:

```
> basic
```

The system displays the Backup to Removable Media menu ([Figure 19](#)).

Figure 19. Backup to Removable Media Menu

```
3 Backup to Removable Media
)Backup History
  Personal Backup
  Schedule Backup to Tape
  System Backup
```

Use the procedures below to access the different menu options of the Backup to Removable Media menu.

Backup History

The Backup History menu option displays the date and time of the last system and incremental backup.

To view the backup history:

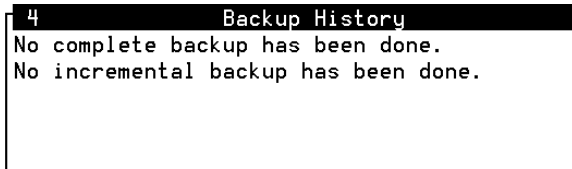

- 1 Start at the Backup to Removable Media menu ([Figure 19 on page 28](#)) and select:

```
> Backup History
```

The system displays the Backup History window ([Figure 20](#)).

Figure 20. Backup History Window

```
4 Backup History
No complete backup has been done.
No incremental backup has been done.
```

- 2 Press **F3** (Cont) to return to the Backup to Removable Media menu ([Figure 19 on page 28](#)).

Backup of All Personal Files

A personal backup copies all the files in your HOME (or personal) directory to either tape or formatted diskettes.

To back up *all* files in your personal directory:

- 1 Start at the Backup to Removable Media menu ([Figure 19 on page 28](#)) and select:

```
> Personal Backup  
  
> Backup Files under /
```

The system displays the Select Removable Media menu ([Figure 21](#)).

Figure 21. Select Removable Media Menu

```
5 Select Removable Media  
> SCSI CD-Rom Drive 1  
Tape Drive 1  
Floppy Drive 1  
3.5 inch 1.44 Mbyte (High Density)  
3.5 inch 720 Kbyte (Low Density)  
3.5 inch 1.2 Mbyte (512 bytes/sector)  
3.5 inch 1.2 Mbyte (1024 bytes/sector)
```

- 2 Select the removable media type.

The system displays a message showing the approximate number of diskettes or tapes, and the time required to backup the HOME directory.

The system prompts you to insert the first diskette or tape. The system periodically prompts you to insert more diskettes or tapes until the backup is complete.

- 3 Press **ENTER** when the backup is complete.

The system redisplay the Backup to Removable Media menu ([Figure 19 on page 28](#)).

Backup of Selected Personal Files

This procedure backs up selected files and directories in your HOME directory to either tape or formatted diskette.

To back up selected personal files or directories:

- 1 Start at the Backup to Removable Media menu ([Figure 19 on page 28](#)) and select:

```
> Personal Backup
```

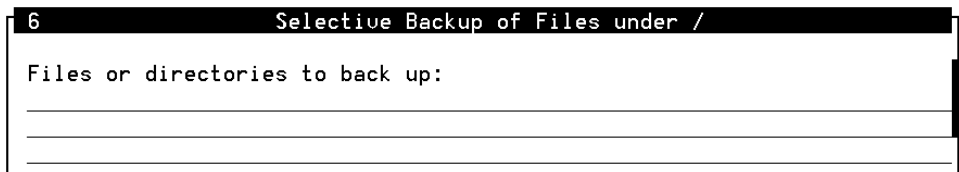

```
> Backup Files under /
```

The system displays the Select Removable Media menu ([Figure 21 on page 30](#)).

- 2 Select the removable media type.

The system displays the Selective Backup of Files under / window ([Figure 22](#)).

Figure 22. Selective Backup of Files under / Window

```
6 Selective Backup of Files under /
Files or directories to back up:
_____
_____
_____
```

- 3 Enter the file names and directory names to be backed up. Separate each entry with a space in the Files or directories to back up: field.

Note: All files and directories must be in the HOME directory or in a subdirectory of HOME.

- 4 Press F3 (Save).

The system displays a message showing the approximate number of diskettes or tapes, and the time required to backup the HOME directory.

The system prompts you to insert the first diskette or tape. The system periodically prompts you to insert more diskettes or tapes if they are needed until the backup is complete.

- 5 Press **ENTER** when the backup is complete.

The system redisplay the Backup to Removable Media menu ([Figure 19 on page 28](#)).

Schedule a Backup to Tape

The Schedule Backup to Tape menu option allows you to:

- Add a system or incremental backup.
- Change a previously scheduled backup request.
- Delete a previously scheduled backup request.
- Display the scheduled backup list.

Note: You need either root or system administration privileges to add, change, or delete a scheduled backup. You do not need those privileges to display a list of scheduled backups.

Add a Backup

To schedule a new backup to tape:

- 1 Start at the Backup to Removable Media Menu ([Figure 19 on page 28](#)) and select:

```
> Schedule Backup to Tape
> Add
```

The system displays the Schedule a System Backup window ([Figure 23](#)).

Figure 23. Schedule a System Backup Window

```
5      Schedule a System Backup
Type of Backup: System Backup
Month(s) of the Year: all
Day(s) of the Month: all
                    _____
                    _____
Day(s) of the Week: all
Time of the Day: 02:00
```

- 2 Press **F2** (Choices) to toggle between System Backup and Incremental System Backup in the `Type of Backup:` field. A system backup (field default) performs a back up of all system and user files installed or modified since the voice system was first installed. An incremental backup performs a back up of all system and user files since the last backup.
- 3 Use one of the following methods to enter a value in the `Month(s) of the Year:` field:
 - ~ Type a number from 1 to 12 where January is 1 and December is 12 to indicate a single month.
 - ~ Type two numbers separated by a hyphen to indicate a range of months. For example, type **1-8** to instruct the system to perform backups of January through August.
 - ~ Press **F2** (Choices) and press **F2** (Mark) to select one or more months. Press **F3** (Enter) to save the selected month or months and return to the `Month(s) of the Year:` field.

The default value is "all," to back up all months.

- 4 Use one of the following methods to enter a value in the `Day(s) of the Month:` field:
 - ~ Type a number from 1 to 31 corresponding to the day of the month to indicate a single day.

- ~ Type two numbers separated by a hyphen to indicate a range of days. For example, type **14-20** to instruct the system to perform a backup every day from day 14 through day 20 of the month.
- ~ Press **F2** (Choices) and press **F2** (Mark) to select one or more days. Press **F3** (Enter) to save the selected day or days and return to the `Day(s) of the Month:` field.

The default is “all,” to back up all days of the month.

5 Use one of the following methods to enter a value in the `Day(s) of the Week:` field:

- ~ Type the first letter of the day to indicate a single day of the week, or Press **F2** (Choices) to select a single day from a menu.

Note: Sunday is *Su* and Thursday is *Th*. Every other day of the week is indicated by its first letter.

- ~ Type two days, separated by a hyphen to indicate a range of days. For example, type **M-Th** to instruct the system to perform a backup every Monday, Tuesday, Wednesday, and Thursday.
- ~ Press **F2** (Choices) and press **F2** (Mark) to select one or more days. Press **F3** (Enter) to save the selected day(s) of the week and return to the `Day(s) of the Week:` field.

The default is “all,” to back up all days of the week.

6 Set the Time of Day: field:

a Type a number in the Hours portion of the field to indicate the hour, where 00 is midnight and 23 is 11:00 p.m. Or, press **F2** (Choices) to select from a menu.

b Press .

The system places the cursor in the minutes portion of the field.

c Type a number from 0 to 59 to indicate the minutes past the hour.

The default time is 02:00, to start the backup at 2:00 a.m.

7 Press **F3** (Save).

The system displays a confirmation window that asks whether you want to continue to schedule the backup.

8 Do one of the following:

~ To confirm the backup schedule, press **F3** (Cont).

The system returns to the Schedule Backup to Tape menu.

~ To cancel the backup schedule, press **F6** (Cancel).

The system returns to the Schedule Backup to Tape menu.

Change Scheduled Backup Settings

To change scheduled backup settings:

- 1 Start at the Backup to Removable Media menu ([Figure 19 on page 28](#)) and select:

The system displays the Change Scheduled Backup window ([Figure 24](#)).

Figure 24. Change Scheduled Backup Window

5 Change Scheduled Backup				
+I	Month:5	Date:2-22	Day:M-F	00:00
I	Month:all	Date:1	Day:F	19:00
I	Month:all	Date:all	Day:all	19:00

- 2 Select the scheduled backup to be changed and press **F2** (Mark).
- 3 Press **F3** (Enter).

The system displays the Change Scheduled Backup Information window ([Figure 25](#)).

Figure 25. Change Scheduled Backup Information Window

```
6 Change Scheduled Backup Information
Type of Backup: Incremental System Backup
Month(s) of the Year: 5
Day(s) of the Month: 2-22
Day(s) of the Week: M-F
Time of the Day: 07:00
```

- 4 Change the information as appropriate. See [step 2](#) through [step 6](#) in [Add a Backup on page 34](#) for information on how to add data to the fields in this window.
- 5 Press **F3** (Save).

The system displays a confirmation window that asks whether you want to continue to schedule the backup.

6 Do one of the following:

~ To confirm the backup schedule, press **F3** (Cont).

The system returns to the Schedule Backup to Tape menu.

~ To cancel the backup schedule, press **F6** (Cancel).

The system returns to the Schedule Backup to Tape menu.

Delete a Scheduled Backup

To delete scheduled backups:

1 Start at the Backup to Removable Media menu ([Figure 19 on page 28](#)) and select:

```
> Schedule Backup to Tape  
> Delete
```

The system displays the Delete Scheduled Backups window ([Figure 26 on page 41](#)).

Figure 26. Delete Scheduled Backups Window

Delete Scheduled Backups				
5				
+I	Month:all	Date:2-22	Day:M-F	00:00
I	Month:all	Date:1	Day:F	19:00
I	Month:all	Date:all	Day:all	19:00

2 Select the scheduled backup to be deleted and press **F2** (Mark). Select as many of the entries as necessary.

3 Press **F3** (Enter).

The system displays a confirmation window to confirm the backups marked for deletion.

4 Do one of the following:

~ To confirm the backup deletion, press **F3** (Cont).

The system returns to the Schedule Backup to Tape menu.

~ To cancel the backup deletion, press **F6** (Cancel).

The system returns to the Schedule Backup to Tape menu.

Display Scheduled Backups

To display a list of scheduled backups:

- 1 Start at the Backup to Removable Media menu ([Figure 19 on page 28](#)) and select:

The system displays the Display Scheduled Backup window ([Figure 27](#)).

Figure 27. Display Scheduled Backups Window

- 2 Press **F3** (Cont) or **F6** (Cancel) to return to the Schedule Backup to Tape menu ([Figure 19 on page 28](#)).

Performing Extended Backup Services

See “Backing Up the UCS 1000 R4.2 System” in Chapter 3, “Common System Procedures,” in *UCS 1000 R4.2 System Reference*, 585-313-210, for information on when and how to conduct extended backups.

File System Creation, Checking, and Mounting

File Systems administration allows you to:

- Check for and repair errors on a file system.
- Set file system defaults.
- Monitor disk usage for all file systems.
- Display a list of installed file system types.
- List files by age or size.
- Identify the file system type.
- Create a new file system.
- Mount or unmount a file system.

[Figure 28](#) shows the options available for file system administration. See *System Files and Devices Reference* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 28. Manage File Systems Menu

```
2      Manage File Systems
)check  - Check a File System
defaults - Manage Defaults
diskuse - Display Disk Usage
display - Display Installed Types
fileage - List Files by Age
filesize - List Files by Size
identify - Identify File System Type
list    - List Mounted File Systems
make    - Create a File System
mount   - Mount a File System
unmount - Unmount a File System
```

Machine Configuration, Display, and Shutdown

Machine administration allows you to:

- Display system configuration information.
- Shut down the machine.

- Reboot the machine.
- Display a list of users who are logged on.

[Figure 29](#) shows the options available for machine administration. See *System Files and Devices Reference* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 29. Machine Configuration Display and Shutdown Menu

```
2      Machine Configuration Display and Shutdown
)configuration - System Configuration Display
shutdown      - Stops All Running Programs and Halts Machine
reboot        - Stops All Running Programs and Reboots Machine
whos on       - Displays List of Users Logged onto Machine
```

Memory Size Disparity

The system may show that available memory is different than the amount that is actually available. See "Setting Up the UnixWare Environment," in Chapter 5, "Installing the UCS 1000 R4.2 Base System Software," in *UCS 1000 R4.2 Maintenance*, 585-313-126, for information about this disparity.

Network Services Administration

Network Services administration allows you to:

- Make network selections.
- Manage distributed file systems.
- Perform name-to-address translations.
- Manage basic networking.

[Figure 30](#) displays the options available for network services administration. See *Network Administration* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 30. Network Services Management Menu

```
2 Network Services Management
>attr_map - Attribute Mapping Administration
basic_networking - Basic Networking Utilities Management
cr1 - IAF Scheme cr1 Key Management
name_map - Name Mapping Administration
remote_files - Distributed File System Management
selection - Network Selection Management
name_to_address - Machine and Service Address Management
```

Port Access Services and Monitors

Ports administration allows you to monitor and service ports, set up quick terminal, and manage terminal line (tty) settings.

[Figure 31](#) shows the options available for ports administration. See *System Administration Volume 1* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 31. Service Access Management Menu

```
2 Service Access Management
>port_monitors - Port Monitor Management
port_services - Port Service Management
quick_terminal - Quick Terminal Setup
tty_settings - Terminal Line Setting Management
```

Printer Configuration and Services

See [Chapter 6. Peripheral Administration](#), for the procedures to configure a printer for use with the voice system.

Restore from Backup Data

Restore service administration allows you to perform basic and extended restore services.

Note: If you want to back up and restore speech files, see the [spsav](#) command in [Appendix A. Summary of Commands](#).

[Figure 32](#) shows the options available for restore service administration.

Figure 32. Restore Service Management Menu

```
2 Restore Service Management
>basic - Basic Restore Service
extended - Extended Restore Service
```

Basic Restore Services

Basic restore services allow you to perform a personal restore or a system restore. [Figure 33](#) shows the options available for the Basic Restore Service.

Figure 33. Restore from Removable Media Menu

```
3 Restore from Removable Media
>Personal Restore
System Restore
```

Extended Restore Services

Extended restore services allow you to:

- Specify the login of the operator who should be notified when a request that requires operation intervention is queued.
- Respond to restore requests.
- Restore files, directories, file systems, or a data partition from a backup archive.
- Display or modify the status of pending restore requests.

[Figure 34](#) shows the options available for the Extended Restore Service.

Figure 34. Extended Restore Service Menu

```
3 Extended Restore Service
>operator - Set/Display the Restore Operator
respond - Respond to Restore Job Prompts
restore - Restore from Backup Archives
status - Modify/Report Pending Restore Request Status
```

Schedule Automatic Task

Schedule task administration allows you to add, change, delete, and display a task scheduled through cron.

[Figure 35](#) shows the options available for schedule task administration. See *System Administration Volume 1* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 35. Schedule Automatic Task Menu

```
2 Schedule Automatic Task
>Add
  Change
  Delete
  Display
```

Security Management

Security management allows you to manage the security features on the system. Currently, this includes only the audit trail facility management.

[Figure 36](#) shows the options available for audit trail facility management. This menu includes the functions for:

- Managing audit criteria
- Enabling and disabling auditing
- Displaying audit information
- Displaying and setting event log parameters on the system

Note: To use the audit subsystem, you must be logged in at the SYS_PRIVATE security level, be a member of group audit, and be able to access the commands within the AUD role.

Figure 36. Audit Trail Facility Management Menu

```
3 Audit Trail Facility Management
>criteria - Audit Criteria Management
disable - Disable Auditing
enable - Enable Auditing
parameters - Event Log Parameter Management
report - Display Audit Data
```

Software Installation and Removal

Software administration allows you to install software, display information about software packages, store software without installing it, and remove software.

[Figure 37](#) shows the options available for software administration. See *System Files and Devices Reference* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 37. Software Installation and Information Management Menu

```
2 Software Installation and Information Management
)check - Checks Accuracy of Installation
defaults - Sets Installation Defaults
install - Installs Software Packages
interact - Stores Interactions with Package
list - Displays Information about Packages
read_in - Stores Packages Without Installing
remove - Removes Packages
```

Note: All the necessary software installation procedures for the UCS 1000 R4.2 system are described in Chapters 5 through 7 in *UCS 1000 R4.2 Maintenance*, 585-313-126.

Storage Device Operations and Definition

Storage devices administration allows you to:

- Copy information from one volume to another.
- Display storage device information.
- Erase the contents of a volume.
- Configure a storage device on the system.
- Reconfigure a storage device on the system.

A storage device may be integral disks, diskettes, SCSI data storage devices, nine-track tapes, and other devices configured on the system. The UCS 1000 R4.2 system uses integral disks (hard disks), diskettes, and tapes as storage devices.

[Figure 38](#) shows the options available for storage administration. See *System Files and Devices Reference* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 38. Storage Device Operations and Definitions Menu

```
2 Storage Device Operations and Definitions
>add - Add Storage Device
copy - Makes Duplicate Copies of Storage Volumes
devices - Device Alias and Attribute Management
display - Displays Information About Storage Devices
erase - Erases the Contents of Storage Volumes
format - Formats Removable Volumes
groups - Device Group Administration
preSUR4 - Disk Operations
remove - Remove Storage Device
```

System Name, Date and Time, and Initial Password Setup

System setup administration allows you to administer the following system characteristics:

- Environment (date, time, time zone)
- Passwords
- Machine name
- Network node name
- Initial user logins

 **CAUTION:**

Your system's machine name is used by the Feature Licensing software. Call your support center before changing the machine name to avoid losing any of your feature licenses.

[Figure 39](#) shows the options available for system setup administration.

Figure 39. System Name, Date, Time and Initial Password Setup Menu

```
2      System Name, Date Time and Initial Password Setup
>datetime      - System Date and Time Information
file_maintenance - Maintain files in /etc/default
nodename       - System Name and Network Node Name of the Machine
password       - Assign Administrative Login Passwords
setup          - Set up System Information for First Time
```

User Login and Group Administration

Users administration allows you to manage logins and groups on your system, including:

- Adding users or groups
- Defining defaults for adding users
- Listing users or groups
- Modifying attributes of users or groups
- Redefining user password information
- Removing users or groups

[Figure 40](#) shows the options available for users administration. See *System Owner Handbook* in the Novell UnixWare documentation set for additional information about each of these options.

Figure 40. User Login and Group Administration Menu

```
2 User Login and Group Administration
>add - Add Users or Groups
defaults - Define Defaults for Adding Users
list - List Users or Groups
modify - Modify Attributes of Users or Groups
password - (Re-)define User Password Information
remove - Remove Users or Groups
```

Exit UNIX System Administration Menu

To exit Unix System Administration:

- 1 Press **F7** (Cmd-Menu).

The system displays the Command Menu ([Figure 41](#)).

Figure 41. Command Menu

- 2 Select:

The system returns you to the system prompt #.

3 Voice System Administration

Overview

The Voice System Administration menu provides access to many administrative options. This chapter describes how to access the Voice System Administration menu, and describes all of the administrative options. This chapter contains the reference and procedural information for the Configuration Management option.

Accessing the Voice System Administration Menu

To access the Voice System Administration menu:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

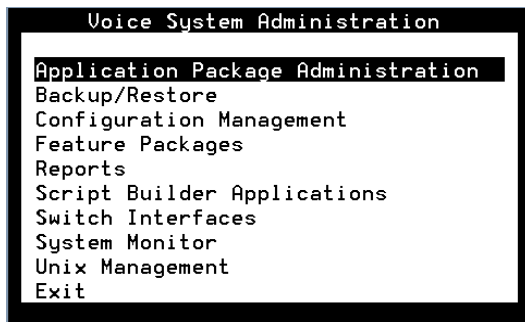

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cv`is`_menu**

The system displays the Voice System Administration menu ([Figure 42](#)).

Figure 42. Voice System Administration Menu

Voice System Administration Menu Options

From the Voice System Administration menu, you have access to all of the major administrative features of the voice system.

This section provides a brief overview of each of the administrative options on this menu.

Application Package Administration

The Application Package Administration menu provides administrative access to the applications currently installed on your system.

Backup/Restore

The Backup/Restore menu simplifies the backup and restore procedures by providing a user interface for differential and full backups.

See "Common System Procedures," in *UCS 1000 R4.2 System Reference*, 585-313-210, for more information on performing backup and restore procedures.

Configuration Management

The Configuration Management menu provides capabilities for you to perform the following administrative tasks:

- Add or remove database access IDs
- License features to the voice system
- Configure host sessions and manage host protocols
- Modify system messages
- Administer alarms
- Diagnose equipment
- Report system status
- Stop and start the voice system
- Manage all voice system circuit card resources
- Administer channels numbers and functionality

See [Configuration Management on page 62](#) for more information.

Feature Packages The Feature Packages menu provides administrative access to the optional feature packages currently installed.

Reports The Reports menu allows you to generate and customize reports for:

- Call classification and data
- System messages
- System traffic

See [Chapter 7, Common Administration](#), for more information on using the Reports menu.

Switch Interfaces The Switch Interfaces menu provides access to administer digital switch parameters.

See [Chapter 4, Switch Interface Administration](#), for more information on using the Switch Interfaces menu.

System Monitor The System Monitor window displays the voice channels on the system and provides input on channel states (on-hook, dialing, and so on), call states, and caller input.

See [Chapter 7, Common Administration](#), for more information on using the System Monitor window.

Unix Management The Unix Management menu provides capabilities to format diskettes and tapes, administer printers and modems, install and remove software, and modify the system time and date.

See [Chapter 6, Peripheral Administration](#), for more information on administering printers, modems, and terminals.

Configuration Management

To access the Configuration Management menu:

- 1 Start at the Voice System Administration menu ([Figure 42 on page 59](#)) and select:

```
> Configuration Management
```

The system displays the Configuration Management menu ([Figure 43 on page 63](#)).

Figure 43. Configuration Management Menu

The Configuration Management menu contains the following options:

- Feature licensing (display Feature Licensing *only*)
- Message administration
- Remote alarming administration

Note: Remote alarming is not supported on UCS 1000 R4.2 systems.

- System control
- Voice equipment

See [Chapter 5, Database Administration](#), for information on Database Administration.

Use the procedures in the following sections to perform voice system administration for the supported Configuration Management menu options.

Feature Licensing

Feature Licensing allows customers to purchase features on a per-channel basis. Only Lucent services personnel can activate and change the feature licenses. Feature licenses cannot be modified by the administrator.

An administrator can display and print a report of the current feature licenses.

CAUTION:

Your system's machine name is used by the Feature Licensing software. Call your support center before changing the machine name and thus avoid losing any of your feature licenses.

To access the Feature Licensing window and display the current feature licenses:

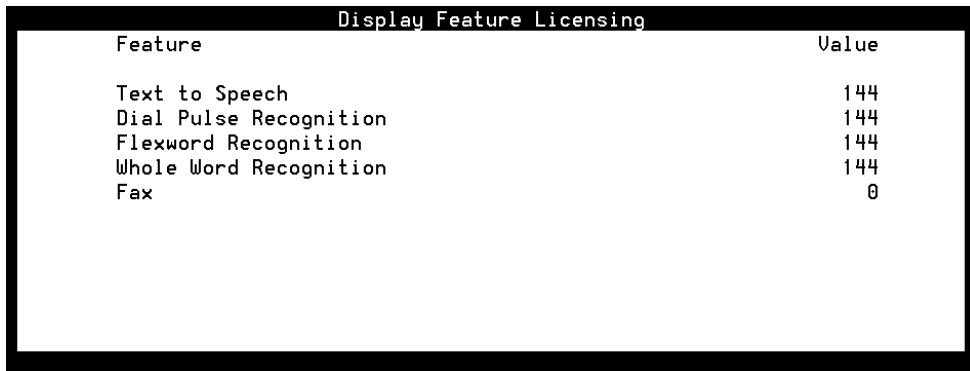

- 1 Start at the Configuration Management menu ([Figure 43 on page 63](#)) and select:

```
> Feature Licensing
```

The system displays the Display Feature Licensing window ([Figure 44 on page 65](#)).

Note: [Figure 44](#) is a sample window. Your Display Feature Licensing window may look different depending on the feature packages you purchased.

Figure 44. Display Feature Licensing Window

Feature	Value
Text to Speech	144
Dial Pulse Recognition	144
Flexword Recognition	144
Whole Word Recognition	144
Fax	0

Printing a Feature License Report

To print a report of the current system feature licenses:

- 1 Start at the Display Feature Licensing window ([Figure 44 on page 65](#)) and press **F8** (Actions).

The system displays the Actions menu ([Figure 45](#)).

Figure 45. Actions Menu

- 2 Select:

The system prints a copy of the Display Feature Licensing window ([Figure 44 on page 65](#)).

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278 in Chapter 6, Peripheral Administration](#), for more information about printer administration.

Message Administration

Messages are used to provide information about events and errors during system operations. System messages vary in content, priority, destination, and threshold parameters. Use the System Message Administration window to:

- List all the parameters associated with a particular system message.
- Add or remove a new destination to or from the current list of destinations for the current system message.
- Modify a message priority.
- Modify the system message threshold period.
- Add or remove a new threshold or threshold message ID pair to or from the current list of thresholds for the current system message.

Note: Some messages are generated with destinations and priorities that are not administrable through the System Message Administration windows (that is, GEN001, GEN002, and THR001–4). Almost all other messages can be administered through the System Message Administration windows.

Accessing Message Administration

To access message administration:

- 1 Start at the Configuration Management menu ([Figure 43 on page 63](#)) and select:

```
> Message Administration
```

The system displays the System Message Administration window ([Figure 46](#)).

Figure 46. System Message Administration Window

```
System Message Administration
Message ID: _____
```

- 2 Enter the message ID of the message you want to administer in the Message ID: field, or press **F2** (Choices) to choose from a menu of currently defined messages.

3 Press F3 (Save).

The system displays the System Message Display window ([Figure 47](#)).

Figure 47. System Message Display Window

```
System Message Display

Message Id:          SPIP001 (SPIP_SBRK)
Message Priority:    -
Message Destinations: log|event|uexLog|uexLog

Threshold Period:   3m
Message Thresholds:
Threshold           Threshold Message Id
-----
          50          THR003 (THRESH_MAJOR)

Message Text:
```

[Table 4 on page 70](#) describes the fields in this window.

Table 4. Field Descriptions for the System Message Display Window

Field	Description
Message ID:	Specifies a unique name for each message in the system.
Message Priority:	Specifies the urgency level of the message. The Message Priority may be NONE or – (for none), * (for minor), ** (for major), or *C (for critical).
Message Destinations:	Specifies a list of destinations where the message should be sent. By default, messages are sent to the message master log and either the alarm log (if the message is an alarm) or the event log (if the message is an event).
Threshold Period:	Specifies the length of time the message is included in the threshold count, provided that one or more thresholds are defined for this message.
Message Thresholds:	Shows the message threshold for the corresponding Message ID in the Threshold Message ID: column. Most messages are not associated with a threshold.

1 of 2

Table 4. Field Descriptions for the System Message Display Window

Field	Description
Threshold:	Specifies the number of messages to be generated within the threshold period necessary to trigger the threshold action.
Threshold Message ID:	Specifies the ID of the message to be generated when a threshold is reached. The priority and the destinations for the threshold message should be meaningful as a thresholding action. For example, message ID VROP003 may have a priority of minor (*), while its corresponding threshold message ID could be THR003 which has a major (**) priority. Generating the THR003 message after enough VROP003 messages have been generated within the Threshold Period is the threshold action. THR001, THR002, THR003, and THR004 have priorities of none (-), minor (*), major (**), and critical (*C), respectively.
Message Text:	Text displayed when the message is generated. The message text can not be administered from the System Message Display window.

2 of 2

Adding Message Destinations

The system's message log provides a complete account of all messages generated by the voice system. All system messages are assigned to the appropriate destination during installation.

Note: If a message is changed from the event destination to the alarm destination, a similar change should be made on the message priority from none (–) to minor (*) and vice versa.

To add a destination to a message:

- 1 Start at the System Message Display window ([Figure 47 on page 69](#)) for a given message, and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 2 Press **F1** (Add–Dest).

The system displays the Add Message Destination window ([Figure 48](#)).

Figure 48. Add Message Destination Window

The screenshot shows a window titled "Add Message Destination" with a text input field labeled "Message Destination:" followed by a blank line for text entry.

- 3 Enter the destination for the message you want to add in the `Message Destination:` field or press **F2** (Choices) to select from a menu.

Valid message destinations are:

- ~ `stderr` — The standard error of the process generating the message. Since most system processes redirect standard error to the system console, specifying this destination may result in the message being sent to the system console.
- ~ `console` — The system console or `/dev/console`.
- ~ `alertPipe` — A specially named pipe for messages that must be sent directly to the alerter. The alerter pipe is used for some special system processes. Specification of the alerter pipe for other system messages has little or no effect on the system message facility or on the alerter itself. The system is distributed with some messages specified with the alerter pipe as a destination. This destination should not be removed from the message.

Note: Separating alarm destinations from event destinations ensures that alarm messages do not overrun event messages, and vice versa.

- ~ `alarm` — Specifies that the delivery system send all alarm level messages, that is, minor, major, and critical (denoted by `“*”`, `“**”` and `“*C”`, respectively) to the alarm log. The alarm log may be accessed via the **display messages** command or the Message Log Report window.

~ event — Specifies that the delivery system send all event level messages (priority “-”) to the event log. The event log may be accessed via the **display messages** command or the Message Log Report window.

4 Press **F3** (Save).

The system redisplay the System Message Display window ([Figure 47 on page 69](#)) showing the new message destination.

5 Complete the [Saving Changes and Exiting Message Administration on page 83](#) procedure.

The system installs the changes on the voice system.

Removing Message Destinations

This procedure allows you to remove a destination from the current list of destinations for the current system message.

To remove a message destination:

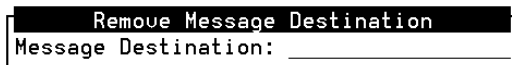

1 Start at the System Message Display window ([Figure 47 on page 69](#)) for a given message, and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

2 Press **F2** (Rem-Dest).

The system displays the Remove Message Destination window ([Figure 49](#)).

Figure 49. Remove Message Destination Window

Remove Message Destination
Message Destination: _____

- 3 Enter the Message Destination that you want to remove in the `Message Destination:` field, or press **F2** (Choices) to select from a menu.

Note: The destination on **log** is not a valid choice since this destination cannot be removed using the Remove Message Destination window.

- 4 Press **F3** (Save).

The system redisplay the System Message Display window ([Figure 47 on page 69](#)) showing the removed message destination.

- 5 Complete the [Saving Changes and Exiting Message Administration on page 83](#) procedure.

The system installs the changes on the voice system.

Adding Thresholds

Message thresholds are triggering devices that alert operations personnel to take action when a certain number of messages are generated over a certain period of time. Message thresholding allows for escalation of message priority or criticality. A system message may be of little concern when it occurs in small numbers over long time intervals. However, an increase of message occurrences over shorter time intervals may indicate more serious problems with the system. Message thresholding sends a new message to be sent when a threshold is reached. The new message may be higher in priority and have a different destination set than the original message.

This procedure adds a new threshold and thresholding message ID pair to the current list of thresholds for the current system message.

To add a message threshold:

- 1 Start at the System Message Display window ([Figure 47 on page 69](#)) for a given message, and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 2 Press **F3** (Add-Thsh).

The system displays the Add Threshold window ([Figure 50](#)).

Figure 50. Add Threshold Window

Add Threshold	
Threshold:	_____
Threshold Message Id:	_____

- 3 Enter a nonnegative integer threshold value or **none** in the `Threshold:` field.
- 4 Enter **THR001** (for none), **THR002** (for minor), **THR003** (for major), or **THR004** (for critical) in the `Threshold Message Id:` field, or press **F2** (Choices) to select from a menu.
- 5 Press **F3** (Save).

The system redisplay the System Message Display window ([Figure 47 on page 69](#)) showing the new message threshold.

- 6 Complete the [Saving Changes and Exiting Message Administration on page 83](#) procedure.

The system installs the changes on the voice system.

Removing Thresholds

This procedure allows you to remove a threshold or a threshold message ID pair from the list of thresholds for the current system message.

To remove a message threshold:

- 1 Start at the System Message Display window ([Figure 47 on page 69](#)) for a given message, and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 2 Press **F4** (Rem-Thsh).

The system displays the Remove Threshold window ([Figure 51](#)).

Figure 51. Remove Threshold Window

Remove Threshold
Threshold: _____

- 3 Enter a nonnegative integer message threshold value in the Threshold: field.
- 4 Press **F3** (Save).

The system redisplay the System Message Display window ([Figure 47 on page 69](#)) showing the message threshold removed.

- 5 Complete the [Saving Changes and Exiting Message Administration on page 83](#) procedure.

The system installs the changes on the voice system.

Modifying Message Priorities

This procedure allows you to modify message priority. When the system is installed, each message is assigned a particular priority. In most cases, these priorities are appropriate and do not need to be modified. Depending on the type of application, however, you may want to modify a message priority.

Events are messages of priority none (denoted by “–” in the System Message Administration window). Alarms are messages of priority minor, major, and critical (denoted by “*”, “***”, and *C, respectively) in the System Message Administration window.

Note: If you modify the message priority of some system messages, it can have an impact on other processes within the system. For example, if you change the message priority of HDWR001 to critical (*C), the alarm on the TAM is also changed to critical. See "HDWR Alarms and Log Messages" in Chapter 4, "Alarms and Log Messages," in *UCS 1000 R4.2 System Reference*, 585-313-210, for more information on the HDWR alarms and the TAM.

To modify a message priority:

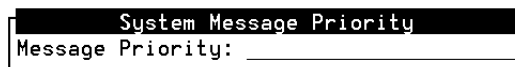

- 1 Start at the System Message Display window ([Figure 47 on page 69](#)) for a given message, and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 2 Press **F5** (Msg-Prio).

The system displays the System Message Priority window ([Figure 52](#)).

Figure 52. System Message Priority Window

- 3 Enter a priority in the `Message Priority:` field or press **F2** (Choices) to select from a menu.

- 4 Press **F3** (Save).

The system redisplay the System Message Display window ([Figure 47 on page 69](#)) showing the message threshold removed.

- 5 Complete the [Saving Changes and Exiting Message Administration on page 83](#) procedure.

The system installs the changes on the voice system.

Modifying Threshold Periods

This procedure allows you to modify the system message threshold period, or the interval of time over which messages are counted for a given threshold.

To modify a threshold period:

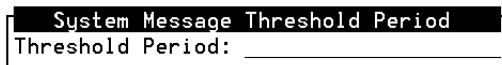

- 1 Start at the System Message Display window ([Figure 47 on page 69](#)) for a given message, and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 2 Press **F6** (Thsh-Per).

The system displays the System Message Threshold Period window ([Figure 53](#)).

Figure 53. System Message Threshold Period Window

System Message Threshold Period
Threshold Period: _____

- 3 Enter a time interval in the `Threshold Period:` field or press **F2** (Choices) to select from a menu.

You must enter the threshold period as a time interval with the following syntax:

***number*[*dimension*] *number*[*dimension*]**

where *number* is a positive integer and *dimension* is one of the following single characters:

- ~ **w** for weeks
- ~ **d** for days
- ~ **h** for hours
- ~ **m** for minutes
- ~ **s** for seconds

[Table 5](#) provides examples of threshold periods and the required syntax.

Table 5. Threshold Period Examples

Specification	Value or Description
1s 1h	A 3601-second threshold period
2w	A 14-day threshold period
5m 30s	A 330-second threshold period
5m 3m	BAD INTERVAL — Two minute specifications

4 Press **F3** (Save).

The system displays the System Message Display window ([Figure 47 on page 69](#)) showing the new threshold period.

- 5 Complete the [Saving Changes and Exiting Message Administration on page 83](#) procedure.

The system installs the changes on the voice system.

Saving Changes and Exiting Message Administration

CAUTION:

You **MUST** perform this procedure if you want to save your message administration changes.

To save message administration changes and exit the Message Administration menu:

- 1 Start from any menu or window in the Message Administration menus and press **F6** (Cancel) until you return to the System Message Administration window ([Figure 46 on page 68](#)).
- 2 Press **F8** (Chg-Keys).
The system displays the alternate set of function keys.
- 3 Press **F4** (Install).

The system saves changes and returns to the Configuration Management menu ([Figure 43 on page 63](#)).

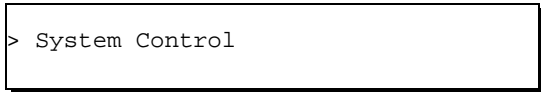

System Control

Use the System Control menu to:

- Display the status of the UCS 1000 R4.2 system
- Start and stop the voice system
- Diagnose circuit cards, channels, and buses

To access the System Control menu:

- 1 Start at the Configuration Management menu ([Figure 43 on page 63](#)) and select:

```
> System Control
```

The system displays the System Control menu ([Figure 54](#)).

Figure 54. System Control Menu

Diagnose

The Diagnose menu allows you to perform diagnostics on system equipment.

Diagnose Equipment

You can run diagnostics on E1/T1, LSPS, and SSP circuit cards. Run diagnostics whenever the system displays a message indicating circuit card failure.

To diagnose equipment:

- 1 Start at the System Control menu ([Figure 54 on page 84](#)) and select:

```
> Diagnose
> Diagnose Equipment
```

The system displays the Diagnose Equipment window ([Figure 55](#)).

Figure 55. Diagnose Equipment Window

Diagnose Equipment	
Equipment to diagnose:	___
Equipment number:	_____
Immediate diagnosis?:	___

[Table 6](#) describes the fields in this window.

Table 6. Field Descriptions for Diagnose Equipment Window

Field	Description
Equipment to diagnose:	Specifies whether the type of equipment to be diagnosed is a circuit card or a bus. Enter card or bus , or press F2 (Choices) to select from a menu. There is no default value for this field. This is a required field.
Equipment number:	A number that identifies each E1/T1, LSPS, or SSP circuit card. Equipment numbers are defined by the position of the circuit card in the circuit card table shown on the Display Voice Equipment window (Figure 61 on page 96). Card range can be from 1 to 16. When you specify a range of circuit cards, cards are diagnosed in order, one at a time. This is a required field. The bus value must be 1 .
Immediate diagnosis?:	Specifies whether there should be immediate diagnosis on the selected circuit card. Type y for yes, n for no, or press F2 (Choices) to select from a menu. If you choose yes, all calls on active channels for the specified equipment are terminated. If there are active calls and you choose no, the circuit card is returned to the original state and diagnostics are not performed. This is a required field. This field does not apply to bus diagnostics.

2 Enter the information as described in [Table 6 on page 86](#).

3 Press **F3** (Save).

The system displays a report showing the status of the specified equipment.

4 Press **F6** (Cancel) repeatedly until you return to the System Control menu.

For more information on diagnostics, see Chapter 2, "Diagnostics," of *UCS 1000 R4.2 System Reference*, 585-313-210.

Renumbering Voice Channels

The Renumber Voice Channels option removes all nonexistent (NONEX) circuit cards from the voice equipment table. It then reorders all existing equipment with E1/T1 circuit cards first, followed by SSP circuit cards. This reordering changes the channel numbers of some circuit cards. However, user-defined characteristics such as options, attributes, and script assignments do not change. If a circuit card is found in the system that was not in the voice equipment table, it is added under the appropriate heading (E1/T1 or SSP) with default settings.

! CAUTION:

Renumbering voice channels shuts the system down immediately and restarts it. When you select this option, a warning is displayed and you are given the option of continuing with the procedure or returning to the System Control menu.

To renumber voice channels:

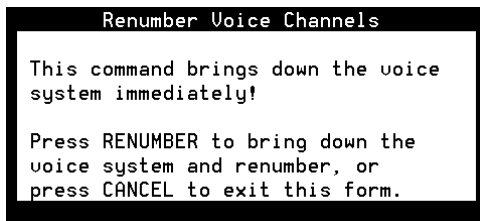

- 1 Start at the System Control menu ([Figure 54 on page 84](#)) and select:

```
> Renumber Voice Channels
```

The system displays the Renumber Voice Channels window ([Figure 56](#)).

Figure 56. Renumber Voice Channels Window

- 2 Press **F3** (Renumber) to continue.

The system renumbers voice channels.

Reporting Voice System Status

To see whether the voice system is running or stopped, and to view the current voice system run level.

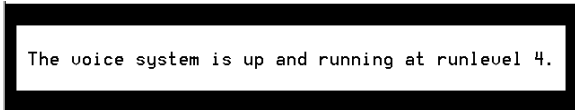

- 1 Start at the System Control menu ([Figure 54 on page 84](#)) and select:

```
> Report Voice System Status
```

The system displays the Status of Voice System window ([Figure 57](#)).

Figure 57. Status of Voice System Window

```
The voice system is up and running at runlevel 4.
```

- 2 Press F1 (Acknowledge Message).

The system returns to the System Control menu ([Figure 54 on page 84](#)).

Stopping the Voice System

This procedure stops the voice system by taking all system channels out of service with the option to wait for in-progress calls to end. Stopping the system is usually done when you are performing some type of routine service such as backup and restore. When the system is stopped, the CPU does the following:

- Places the entire system in the idle state when all lines are free
- Saves internal system tables
- Turns off voice system processes

Use the following procedure to stop the voice system:

- 1 Start at the System Control menu ([Figure 54 on page 84](#)) and select:

```
> Stop Voice System
```

The system displays the Wait Time window ([Figure 58](#)).

Figure 58. Wait Time Window

2 Enter a time interval between 60 and 600 seconds in the `Seconds :` field, or press **F2** (Choices). The default is 180.

Note: During this wait time, all calls in progress are completed, but no new calls are accepted.

3 Press **F3** (Save).

The system displays a message telling you it will stop the voice system if you press **ENTER**.

Note: To return to the System Control menu without stopping the system, press **F6** (Cancel)

4 Press **ENTER**.

The system displays messages telling you it is stopping the voice system.

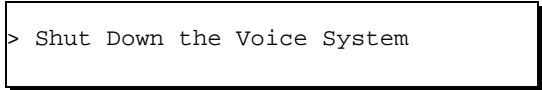

Shutting Down the System

CAUTION:

Always stop the voice system before executing a shutdown. Shutting down the system without stopping the voice system may negatively affect the software.

To shut down the system:

- 1 Start at the System Control menu ([Figure 54 on page 84](#)) and select:

```
> Shut Down the Voice System
```

The system displays the Wait Time window ([Figure 59](#)).

Figure 59. Wait Time Window

- 2 Enter a time interval between 60 and 600 seconds in the `Seconds:` field or press **F2** (Choices).
- 3 Press **F3** (Save).

The system waits the amount of time indicated, and then shuts the system down. The system then returns to the System Control menu ([Figure 54 on page 84](#)).

Starting the Voice System

This procedure allows you to start or restart the voice system. When this process is invoked, all channels that were deactivated when you stopped the voice system are returned to service in the maintenance state they had when the voice system was last running.

To start the voice system:

- 1 Start at the System Control menu ([Figure 54 on page 84](#)) and select:

```
> Start the Voice System
```

- 2 Press **ENTER**.

The system displays messages telling you it is starting up the voice system.

Voice Equipment

Voice equipment includes those circuit cards and their associated channels in the system that provide voice system functionality.

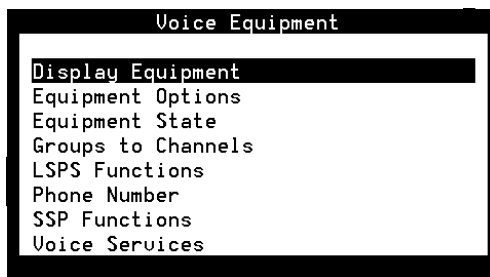

To access the Voice Equipment menu:

- 1 Start at the Configuration Management menu ([Figure 43 on page 63](#)) and select:

```
> Voice Equipment
```

The system displays the Voice Equipment menu ([Figure 60](#)).

Figure 60. Voice Equipment Menu

Note: The LSPS Functions and SSP Functions menu items appear only if you have the ASP Driver and LSPSset packages, respectively, installed.

Use the Voice Equipment menu to:

- Assign, display, and unassign voice system equipment options and states
- Change channel maintenance states
- Assign, display, and unassign channel and telephone number services
- Assign, display, and unassign circuit card and channel functions
- Print a report of voice system circuit card and channel options

Display the Voice Equipment Window

To access the Display Voice Equipment window:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> Display Equipment
```

- ~ Telephone number (PHONE)
- ~ Group number (GROUP)
- ~ Options (OPTS)
- ~ Circuit card type (TYPE)

This window can be several pages long, depending on the display parameters for the window, and the equipment installed in the system.

Press **F2** (Prev Page) and **F3** (Next Page) to move up and down through the pages of this window.

Press **F4** (First Page) to view the first page of the window. Press **F5** (Last Page) to view the last page of the window.

Note: Cards in the NONEX state (that is, those that have been physically removed from the system, or have been "detached" using the **detach** command) do not show up in the Display Voice Equipment window.

Use the following procedure to modify the default display parameters for the Display Voice Equipment window.

Modifying the Display Voice Equipment Window Parameters

You can tailor the Display Voice Equipment window to show a full range of channels or a subrange. The parameters you specify are saved in a file and remain in effect until you change them.

To change the display parameters:

- 1 Start at the Display Voice Equipment window ([Figure 61 on page 96](#)) and press **F8** (Actions).

The system displays the Actions menu ([Figure 62](#)).

Figure 62. Actions Menu

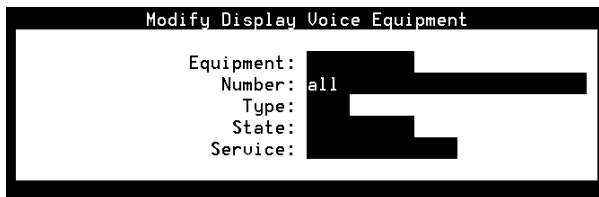

- 2 Select:

The system displays the Modify Display Voice Equipment window (Figure 63).

Figure 63. Modify Display Voice Equipment Window

```
Modify Display Voice Equipment
Equipment:
Number: all
Type:
State:
Service:
```

- 3 Enter one of the following in the `Equipment:` field, or press **F2** (Choices) to select from a menu.
 - ~ **card** — This parameter displays the version of software running on each circuit card (in the `FUNCTION:` field), circuit card options, and the circuit card O.S. Index (slot number) for each of the voice system circuit cards installed.
 - LSPS circuit cards: Information on LSPS circuit cards is displayed with the card options only. LSPS circuit cards do not have channels associated with them.
 - SSP circuit cards: Information on SSP circuit cards is displayed with the card options only. SSP circuit cards do not have channels associated with them.

- **E1/T1**: The circuit card parameter also shows all channel information (with the first two columns in the order `CHAN`, then `CD.PT`), since these types of circuit cards also have associated channels.
 - ~ **channel** (default) — Information displayed with the channel and card parameters is almost identical. However, the card parameter also displays the version of software that is running on each circuit card (in the `FUNCTION:` field), circuit card options, and the circuit card O.S. Index (slot number).
 - ~ **group** — In the standard display, with the `GROUP` column last, only the first seven characters in that field are displayed. For example, a channel may be assigned to groups “1,2,3,4,5,6,7,8,9,10”, but the `GROUP` column only displays “1,2,3,4”.
- 4 (Optional) Enter a single number, or a range of numbers separated by commas or spaces, or **all** (default) in the `Number:` field to specify a certain equipment number or number range to be displayed.
 - 5 (Optional) In the `Type:` field, enter **SSP**, **LSPS**, or **E1/T1** to specify an equipment type, or press **F2** (Choices) to select from a menu. If you leave this field blank, all equipment types are displayed.

- 6 (Optional) In the `State:` field, enter a maintenance state, or press **F2** (Choices) to select from a menu. This field limits the voice equipment display to circuit cards or channels in a particular state. If you leave this field blank, all maintenance states are displayed. See [Equipment State on page 103](#) for a list and description of each maintenance state.
- 7 (Optional) In the `Service:` field, enter a service name, or press **F2** (Choices) to select from a menu. This field is used to limit the voice equipment display to channels that are associated with a particular service or function. This field is valid only if the `Equipment:` field is **channel**. If you leave this field blank, the system does not restrict the display to any one service.

A special service name of “*DNIS_SVC” is available. If you enter ***DNIS_SVC**, the voice equipment display shows the number service based on the calling party’s number.

- 8 Press **F3** (Save).

The system saves the display settings to a file and returns to the Display Voice Equipment window with the modified parameters.

Equipment Options

The equipment options indicate to the voice system the functionality of the digital circuit cards (also known as *voice circuit cards*).

Note: All the digital (E1/T1) circuit cards should be set to **tdm**. It is the only valid setting.

To change voice equipment options for digital circuit cards:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> Equipment Options
```

The system displays the Change Options of Voice Equipment window ([Figure 64](#)).

Figure 64. Change Options of Voice Equipment Window

```
Change Options of Voice Equipment
Talk-tdm: _____
Equipment: _____
Equipment Number: _____
```

- 2 Enter **tdm** in the `Talk-tdm:` field, or press **F2** (Choices) to select from a menu.

Note: If a system application uses background speech or music, changing the equipment option may affect how the callers hears the background speech or music. When the channel is set to *tdm*, foreground speech plays simultaneously with background speech.

Note that background speech plays at a lower volume than foreground speech.

- 3 Enter **circuit card** or **channel** in the `Equipment:` field, or press **F2** (Choices) to select from a menu. If you specify a circuit card, the option is set for all channels of that circuit card.
- 4 Enter a single number or range of numbers to select the voice circuit cards or channels to change in the `Equipment Number:` field, or enter **all** (default).
- 5 Press **F3** (Save).

The system saves the voice equipment options.

Equipment State

The equipment states, listed below, indicate to the voice system whether or not a voice circuit card/channel is ready and able to receive calls, process speech, and so on.

Note: Cards in the NONEX state (that is, those that have been physically removed from the system, or have been "detached" using the **detach** command) do not show up in Display Voice Equipment window.

The Change Equipment State menu option allows you to change the state, or maintenance state, of a card or channel. Some states are valid only for cards

and cannot be used for channels. The following is a description of the different maintenance states for voice equipment:

- MANOOS (manual out-of-service) — Indicates that the circuit card or channel has been taken out of service with a command that was issued manually.

Note: Change SSP and/or LSPS circuit cards to the MANOOS state only when there are no active calls on the system. The MANOOS state disrupts voice playback on all speech processing circuit card channels (if only one speech processing circuit card is installed) or negatively affects voice playback performance on all channels (if more than one speech processing circuit card is installed).

- INSERTV (in service) — Indicates that the circuit card or channel is in service and able to carry a transaction.
- FOOS (facility out-of-service) — Indicates that the circuit card or channel was been taken out of service by the voice system because the link to the switch is out of service (not physically connected, switch down, and so on).
- BROKEN (broken) — Indicates the circuit card or channel did not pass the diagnostics and was taken out of service by the system.

Channels are placed in the broken state by the system. An administrator cannot change a channel to the broken state.

- HWOOS (hardware out-of-service) — Indicates the circuit card or channel is out of service due to one or more of its dependencies being out of service, broken, or not physically connected.
- NETOOS (network out-of-service) — For digital circuit cards or channels only: Indicates that the system is ready for the channel to go inserv, but is waiting for the network switch to also be ready for the channel to go inserv. Note that channels can freeze in this state if the switch is not ready for the channel to go inserv.

As indicated in the list, some maintenance states are reserved for the voice system only. A system administrator cannot place the equipment in these states. However, a system administrator can place the equipment into the MANOOS state, and then into the inserv state. See [Table 7 on page 106](#) for a description of the valid administrator changes.

Table 7. Valid Equipment State Changes

If a Card/Channel is . . .	You May Change It to . . .	For Equipment Type . . .
MANOOS	INSERTV	circuit cards or channels.
INSERTV	MANOOS	circuit cards or channels.
FOOS	MANOOS	circuit cards or channels.
NETOOS	MANOOS	digital circuit cards or channels.
HWOOS	MANOOS	circuit cards or channels.
BROKEN	MANOOS	circuit cards or channels.

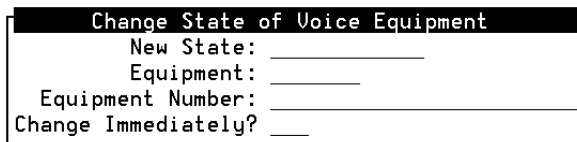

To change the maintenance state of a circuit card or channel:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> Equipment State
```

The system displays the Change State of Voice Equipment window (Figure 65).

Figure 65. Change State of Voice Equipment Window

```
Change State of Voice Equipment
New State: _____
Equipment: _____
Equipment Number: _____
Change Immediately? _____
```

- 2 Enter the state to which the designated equipment should be changed in the `New State:` field or press **F2** (Choices) to select from a menu. Valid choices are **inserv** (in service) and **manoos** (manual out-of-service).
- 3 Enter **channel** or **card** for the type of equipment in the `Equipment:` field, or press **F2** (Choices) to select from a menu.
- 4 Enter the equipment number or numbers for which you want to change the state in the `Equipment Number:` field. Type a single number, a range of numbers separated by commas or spaces, or **all** (default).
- 5 (Optional) Enter **Yes** or **No** in the `Change Immediately:` field. If you enter **Yes**, active calls on the specified equipment are disconnected abruptly. If you enter **No**, the state is changed after all current calls end. The changes might not be displayed immediately if you use the No value. If you leave this field blank, the No value is used as the default.

6 Press F3 (Save).

The system changes the maintenance state of the selected voice equipment.

Suggestions for Changing the Maintenance State of Channels

Use the following information to help you determine why a channel may be placed in a given maintenance state.

Manoos E1/T1 Channels Using E&M Protocol

The following suggestions apply only to individual MANOOS E1/T1 channels using the [E&M protocol](#). Other E1/T1 protocols provide the ability to remove individual channels from service.

At times, you may want to limit the number of calls the system handles by removing some of the E1/T1 channels from service. Note that removing E1/T1 channels, however, may negatively impact the system if the switch uses an inappropriate hunting pattern.

The E&M protocol does not allow you to remove individual channels from service. If a switch using the E&M protocol does not recognize that a channel is in a MANOOS state, it continues to route calls to that channel.

The system thus returns a busy signal to the caller if the switch directs the call to a MANOOS channel. For some hunting patterns (for example, those using a round-robin pattern for new call delivery), this is not desirable. With a round-robin style of delivery, the switch routes a new call to the next channel in the hunt group. When the switch reaches the end of the group, it starts

again at the beginning. Consequently, the caller could receive a busy signal even though there might be other idle channels that are in service.

Ideally, the switch should use all inserv channels before attempting to use any MANOOS channels. You can force the switch to use inserv channels before using MANOOS channels by requesting a switch hunting pattern that always scans for idle channels starting at the beginning of the hunt group. On a 4ESS switch, for example, this is achieved by requesting a “trunk hunt without memory.” You can then limit the number of simultaneous incoming calls by placing the least-used channels (channels at the end of the hunt group) into the MANOOS state. A new call is routed to a channel that is in the MANOOS state only if all inserv channels are being used.

Manoos E1/T1 Channels

When all channels on a E1/T1 circuit card are in the MANOOS state, the circuit card generates a BLUE alarm to the switch. Calls are not routed to any of the channels on that E1/T1 circuit card.

Groups to Channels

The Groups to Channel menu option allows you to assign and unassign channels to one or more equipment groups. For example, an equipment group can be dedicated to outbound call bridging so that bridging does not interfere with incoming calls.

Assigning Groups to Channels

To assign an equipment group to channels:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

The system displays the Assign Channels to Groups window ([Figure 66](#)).

Figure 66. Assign Channels to Groups Window

Assign Channels to Groups

Channels: _____

Groups: _____

- 2 Enter the channel or range of channels that you want to assign to equipment groups in the `Channels:` field. Type a single channel number or a range of channel numbers separated by commas or spaces. To assign all channels to the equipment groups specified in the `Groups:` field, type **all**.

- 3 Enter the equipment group or groups to which you want to assign the channels in the `Groups:` field. Type a single equipment group number, or a range of equipment group numbers separated by commas or spaces. Valid equipment group numbers are 0 to 30.

Note: Equipment group 31 is a reserved group. It is used to specify channels that the system should ignore when it executes a soft seizure (`soft_srz` command). This allows you to mark certain channels as not being in the channel group specified by a soft seizure request on “any channel, any equipment group.” If a channel is assigned to equipment groups 0 and 31, it is only considered for soft seizures that specifically request equipment group 0.

- 4 Press **F3** (Save).

The system assigns the specified channels to the selected equipment groups.

Unassigning Groups to Channels

To unassign an equipment group to channels:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

The system displays the Unassign Channels From Groups window ([Figure 67](#)).

Figure 67. Unassign Channels From Groups Window

Unassign Channels From Groups	
Channels:	<input type="text"/>
Groups:	<input type="text"/>

- 2 Enter the channel or range of channels that you want to unassign to equipment groups in the **Channels:** field. Type a single channel number or a range of channel numbers, separated by commas or spaces. To unassign all channels from the equipment groups specified in the **Groups:** field, type **all**.

3 Enter the equipment group or groups to which you want to unassign the channels in the `Groups:` field. Type a single equipment group number, or a range of equipment group numbers separated by commas or spaces. Valid equipment group numbers are 0 to 30, with equipment group 31 used as a reserved group.

4 Press **F3** (Save).

The system unassigns the specified channels from the selected equipment groups.

LSPS Functions

The LSPS Functions menu option allow you to assign functions to the LSPS circuit cards, or to change the currently assigned functions of LSPS circuit cards.

The LSPS card is in the UNASSIGNED state when it is first installed. The card cannot be put into service while in the UNASSIGNED state. You must first put the card in the MANOOS state before assignments can be made. See [Equipment State on page 103](#) for information on changing states.

Assigning LSPS Functions

To assign functions to LSPS circuit cards:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> LSPS Functions
> Assign/Change LSPS Functions
```

The system displays the Assign LSPS Functions window ([Figure 68](#)).

Figure 68. Assign LSPS Functions Window

```
Assign LSPS Functions
Card Number: █
Code: █
Play: █
Echo Cancellation: █
Whole Word: █
Flexword: █
Text to Speech: █
```

 **CAUTION:**

Be careful when making assignments and reassignments. Assignments made in the Assign LSPS Functions window overwrite any other assignments that are currently in effect on the specified circuit cards.

- 2 Enter a single number or press **F2** (Choices) to select from a menu in the `Card Number:` field. After entering the card number, the current settings are displayed.
- 3 In the remaining fields, enable the function with **Yes** or disable with **No**.

Several of these functions can be used in combination with one another, depending on the type of circuit card and the software installed. [Table 8 on page 116](#) describes the valid functionality combinations.

 **CAUTION:**

You **CANNOT** assign the same function to both an LSPS and an SSP card.

Note: If you move a speech function (such as play, code, echo cancellation, WholeWord, FlexWord, or Text-to-Speech) from an SSP card to an LSPS II card, or vice versa, you must stop and start the voice system for the change to take effect. If you do not, the voice system will continue to use the former assignment.

Table 8. Valid LSPS Function Combinations

Function	Valid for LSPS?
Text-to-Speech	Yes
Code + Play	Yes
Code + FlexWord	Yes
Code + WholeWord	Yes
Code + WholeWord + Echo Cancellation	Yes
WholeWord + Echo Cancellation	Yes

Displaying LSPS Functions

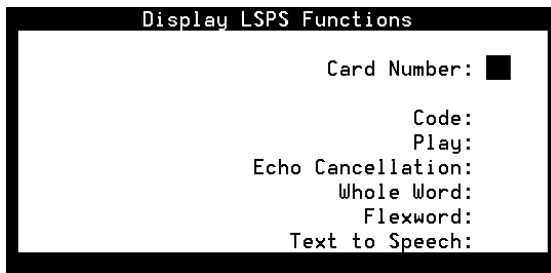

To view the current assignments for the LSPS cards in your system:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> LSPS Functions
> Display LSPS Functions
```

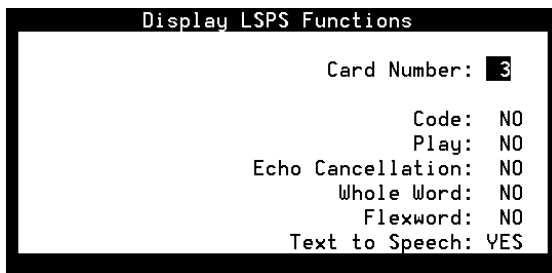

The system displays the Display LSPS Functions window ([Figure 69](#)).

Figure 69. Display LSPS Functions Window

- 2 In the `Card Number:` field, enter a single number or press **F2** (Choices) to select from a menu. After entering the card number, the current settings are displayed ([Figure 70 on page 118](#)).

Figure 70. Example Display LSPS Functions Window

- 3 Press **F6** (Cancel) twice to return to the Voice Equipment menu ([Figure 60 on page 94](#)).

SSP Functions

Using the SSP Functions menu option, you can assign functions to SSP circuit cards or to change the functions that are currently assigned.

The SSP card is in the UNASSIGNED state when it is first installed. The card cannot be put into service while in the UNASSIGNED state. You must first put the card in the MANOOS state before assignments can be made. See [Equipment State on page 103](#) for information on changing states.

Assigning SSP Functions

To assign functions to SSP circuit cards:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> SSP Functions
> Assign/Change SSP Functions
```

The system displays the Assign/Change Functions to SSP Cards window ([Figure 71](#)).

Figure 71. Assign/Change Functions to SSP Cards Window

```
Assign/Change Functions to SSP Cards
Card Number: █
Code: █
Echo Cancellation: █
Fax: █
Play: █
Text to Speech: █
```

 **CAUTION:**

Be careful when making assignments and reassignments. Assignments made in the Assign Functions to SSP Cards window overwrite any other assignments that are currently in effect on the specified circuit cards.

- 2 Enter a single number or press **F2** (Choices) to select from a menu in the `Card Number:` field. After entering the card number, the current settings are displayed.
- 3 In the remaining fields, enable the function with **Yes** or disable with **No**. The optional feature packages shown below may or may not appear in the Assign/Change Functions to SSP Cards window, depending on the software installed on your voice system.

All of these functions can be used in combination with one another. To assign a function, the software package supplying that function must be installed on the voice system.

 **CAUTION:**

You **CANNOT** assign the same function to both an LSPS and an SSP card.

Note: If you move a speech function (such as play, code, echo cancellation, WholeWord, FlexWord, or Text-to-Speech) from an SSP card to an LSPS II card, or vice versa, you must stop and start the voice system for the change to take effect. If you do not, the voice system will continue to use the former assignment.

Displaying SSP Functions

To view the current assignments for the SSP cards in your system:

- 1 Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> SSP Functions
> Display SSP Functions
```

The system displays the Display SSP Functions window ([Figure 72](#)).

Figure 72. Display SSP Functions Window

```
Display SSP Functions
Card Number: ■
Code:
Echo Cancellation:
Fax:
Play:
Text to Speech:
```

- In the `Card Number:` field, enter a single number or press **F2** (Choices) to select from a menu. After entering the card number, the current settings are displayed ([Figure 73](#)).

Figure 73. Example Display SSP Functions Window

- Press **F6** (Cancel) twice to return to the Voice Equipment menu ([Figure 60 on page 94](#)).

Voice Services

The Voice Services menu option allows you to assign, display, and unassign channel and number services.

To access the Voice Services menu:

- Start at the Voice Equipment menu ([Figure 60 on page 94](#)) and select:

```
> Voice Services
```

The system displays the Voice Services menu ([Figure 74](#)).

Figure 74. Voice Services Menu

Channel Services

The Channel Services menu option allows you to assign, display, and unassign channel services.

To access the Channel Services menu:

- 1 Start at the Voice Services menu ([Figure 74 on page 123](#)) and select:

```
> Channel Services
```

The system displays the Channel Services menu ([Figure 75](#)).

Figure 75. Channel Services Menu

Assign Service

The Assign Services to Channels window allows you to specify the service or application to use for incoming calls on one or more channels.

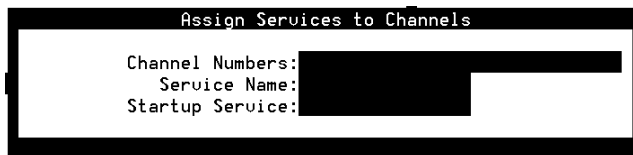

To assign services to channels:

- 1 Start at the Channel Services menu ([Figure 75 on page 124](#)) and select:

```
> Assign Service
```

The system displays the Assign Services to Channels window ([Figure 76](#)).

Figure 76. Assign Services to Channels Window

```
Assign Services to Channels
Channel Numbers:
Service Name:
Startup Service:
```

- 2 In the `Channel Numbers:` field, enter the channel number or range of numbers.

Valid numbers range from 0 to the maximum number of channels in the system. You can enter multiple channels separated by commas or a range of channels using a dash. For example, an entry of **1, 3-5, 10** specifies channels 1, 3, 4, 5, and 10.

- 3 Enter the name of the service that will handle the incoming call in the `Service Name:` field. Valid names are a string of 16 characters or less, or press **F2** (Choices) to select from a menu.

A special service name of `**DNIS_SVC` is available. It allows you to select a number service based on the called and calling numbers. It is also used when multiple services are supported by a single trunk or when

special services are required for specific callers. DNIS (called party) is available with E1/T1 (E&M) and PRI.

Another special service name "ANI" (calling party) is available with PRI.

4 Leave the `Startup Service:` field blank.

5 Press **F3** (Save Assign).

The system assigns the indicated services to the selected channel or range of channels.

Display Channel Services

The Display Channel Services window displays all currently assigned channel services.

To display channel services:

1 Start at the Channel Services menu ([Figure 75 on page 124](#)) and select:

```
> Display Services
```

The system displays the Display Channel Services window ([Figure 77](#)).

Figure 77. Display Channel Services Window

Display Channel Services		
CHANNEL	SERVICE	STARTUP SERVICE
0	-	-
1	-	-
2	-	-
3	-	-
4	-	-
5	-	-
6	-	-
7	-	-
8	-	-
9	-	-

oo

[Table 9](#) describes the columns in this window.

Table 9. Field Descriptions for the Display Channel Services Window

Column Name	Description
CHANNEL	Channel number assigned to the service displayed in the SERVICE column
SERVICE	Name of the service that corresponds to the channel number displayed in the CHANNEL column
STARTUP SERVICE	Name of the service that handles calls requiring special call set up procedures

Unassigning Channel Service

The Unassign Service menu option allows you to unassign services from one or more channels.

To unassign channel service:

- 1 Start at the Channel Services menu ([Figure 75 on page 124](#)) and select:

```
> Unassign Service
```

The system displays the Unassign Services from Channels window (Figure 78).

Figure 78. Unassign Services from Channels Window

- 2 Enter the channel number or range of numbers to be unassigned in the Channel Numbers: field.

Valid numbers range from 0 to the maximum number of channels in the system. You can enter multiple channels separated by commas or a range of channels using a dash. For example, an entry of **1, 3–5, 10** specifies channels 1, 3, 4, 5, and 10.

- 3 Press **F3** (Save).

The system unassigns the selected channel or range of channels.

Number Services

The Number Services menu option allows you to assign, display, and unassign numbers services.

To access the Number Services menu:

- 1 Start at the Voice Services menu ([Figure 74 on page 123](#)) and select:

```
> Number Services
```

The system displays the Number Services menu ([Figure 79](#)).

Figure 79. Number Services Menu

```
Number Services
Assign Service
Display Services
Unassign Service
```

Assign Number Service

The Assign Services to Number window allows you to specify a service or application to use for incoming calls on the called number (DNIS) or calling number (ANI). It is only valid for channels assigned to *DNIS_SVC.

To assign number service:

- 1 Start at the Number Services menu ([Figure 60 on page 94](#)) and select:

```
> Assign Service
```

The system displays the Assign Number Service window ([Figure 80](#)).

Figure 80. Assign Number Service Window

```
Assign Number Service
Called Numbers: [redacted] to [redacted]
Calling Numbers: [redacted] to [redacted]
Service Name: [redacted]
```

- 2 Enter a number, range of numbers, or **any** in the `Called Numbers:` field.

This number or range represents the telephone number or numbers to dial to reach the specified service. The number of digits must match those that the switch provides. You can enter numbers with a comma, a dash, or a space as delimiters. The first column contains a single number, the word **any**, or the first number in the range. The second column contains the last number in the range.

For example, to specify the extension 4876, enter **4876** in column 1 and leave column 2 blank. To specify any number, enter **any** in column 1 and leave column 2 blank. To specify a range 5554876–5555210, enter **555–4876** in column 1 and **555–5210** in column 2.

- 3 Enter the number, range of numbers, or in the `Calling Numbers:` field.

This number or range represents the caller's (or calling party) number or numbers. The number of digits must match those that the switch provides. You can enter numbers with a comma, a dash, or a space as delimiters. The first column contains a single number, the word **any**, or the first number in the range. The second column contains the last number in the range.

For example, to specify the single number 6145554876, enter **6145554876** in column 1 and leave column 2 blank. To specify any number, enter **any** in column 1 and leave column 2 blank. To specify a range 5554876–5555210, enter **555–4876** in column 1 and **555–5210** in column 2.

- 4 Enter a string of 16 characters or less in the `Service Name:` field or press **F2** (Choices) to select from a menu. This field represents the name of the service that handles the incoming call on the channel or channels.
- 5 Press **F3** (Save).

The system assigns a service to the specified number or numbers.

Displaying Number Services

The Display Number Services window displays all currently assigned number services.

Use this procedure to display number services:

- 1 Start at the Number Services menu ([Figure 79 on page 130](#)) and select:

```
> Display Services
```

The system displays the Display Number Services window ([Figure 81](#)).

Figure 81. Display Number Services Window

Display Number Services				
CALLED NUMBERS		CALLING NUMBERS		SERVICE NAME
FROM	TO	FROM	TO	
any		any		any agent

[Table 10](#) describes the columns in this window.

Table 10. Column Description for the Display Number Services Window

Column Name	Description
CALLED NUMBERS	Displays the called number corresponding to the service (E&M and PRI)
CALLING NUMBERS	Displays the calling number corresponding to the service (PRI)
SERVICE NAME	Displays the name of the service that corresponds to the called or calling number

Unassign Number Service

The Unassign Service menu option allows you to unassign services from one or more numbers.

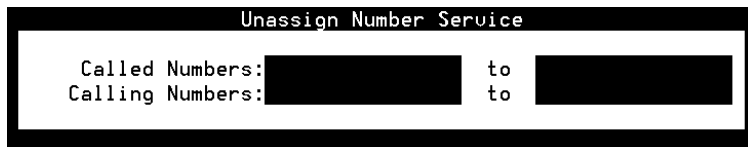

To unassign number service:

- 1 Start at the Number Services menu ([Figure 79 on page 130](#)) and select:

```
> Unassign Service
```

The system displays the Unassign Number Service window ([Figure 82](#)).

Figure 82. Unassign Number Service Window

Unassign Number Service		
Called Numbers:	<input type="text"/>	to <input type="text"/>
Calling Numbers:	<input type="text"/>	to <input type="text"/>

- 2 Enter a number, range of numbers, or **any** in the `Called Numbers:` field.

This number or range represents the telephone number or numbers to dial to reach the specified service. The number of digits must match those that the switch provides. You can enter numbers with a comma, a dash, or a space as delimiters. The first column contains a single number, the word **any**, or the first number in the range. The second column contains the last number in the range.

For example, specify the single number 6145554876, enter **6145554876** in column 1 and leave column 2 blank. To specify any number, enter **any** in column 1 and leave column 2 blank. To specify a range 5554876–5555210, enter **555–4876** in column 1 and **555–5210** in column 2.

- 3 Enter the number, range of numbers, or **any** in the `Called Numbers:` field.

This number or range represents the caller's (or calling party) number or numbers. The number of digits must match those that the switch provides. You can enter numbers with a comma, a dash, or a space as delimiters. The first column contains a single number, the word *any*, or the first number in the range. The second column contains the last number in the range.

For example, to specify the single number 6145554876, enter **6145554876** in column 1 and leave column 2 blank. To specify any number, enter **any** in column 1 and leave column 2 blank. To specify a range 5554876–5555210, enter **555–4876** in column 1 and **555–5210** in column 2.

4 Press **F3** (Save).

The system unassigns a service from the specified number or numbers.

Printing a Voice Equipment Report

Use the voice equipment print option to obtain a complete printout of the voice equipment report.

To print a voice equipment report:

- 1 Start at the Display Voice Equipment window ([Figure 61 on page 96](#)) and press **F8** (Actions).

The system displays the Actions menu ([Figure 45 on page 66](#)).

2 Select:

```
> Print
```

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278](#) in [Chapter 6, Peripheral Administration](#), for more information about printer administration.

FAX Administration

With the Next Generation FAX feature package, you can send and receive faxes. IRAPI commands are used to control the process.

For information on the IRAPI commands used to control FAX, see *UCS 1000 R4.2 Application Development with Advanced Methods*, 585-313-214:

- Chapter 5, "IRAPI"
- Appendix A, "Application Examples" (contains examples of FAX applications)

Note: At least one SSP (CWB1) circuit card and one E1/T1 must be installed and operational. The LSPS II circuit card does not support the FAX feature package.

Log messages FAX001 (FAX print operation filed) and FAX002 (FAX record operation failed) are described in *UCS 1000 R4.2 System Reference*, 585-313-210, along with possible causes for the condition.

Product ID Required

The NGFAX feature package requires a unique identification number. To supply this number, access the Alarm Management window and, in the Product ID field, enter a 10-digit number starting with a "2". This number must be unique within other UCS 1000 R4.2 systems that will send or receive faxes. Follow the procedure below to access the Alarm Management window and complete the Product ID field:

- 1 Access the Administration menu. (See [Accessing the Administration Menus on page 18](#) for instructions on how to access this menu.) From the Administration window, select the following menus:

```
> Voice System Administration
```

```
> Configuration Management
```

```
> Remote Alarming Administration
```

```
> Alarm Management
```

The Alarm Management window is displayed ([Figure 83](#)).

Figure 83. Alarm Management Window

Alarm Management	
Product ID	_____
Alarm Destination	_____
Alarm Origination	INACTIVE
Alarm Level	MINOR
Alarm Suppression	INACTIVE
Clear Alarm Notification	ACTIVE

- 2 In the Product ID field, enter a 10-digit number starting with a "2" that is unique within other UCS 1000 R4.2 systems that will be sending or receiving faxes. Do not enter information in the Alarm Destination field, even if the system prompts you for that information, and do not alter the information in the remaining fields.
- 3 Save before exiting.

4 Switch Interface Administration

Overview

This chapter provides procedural information and reference information for administering the supported digital switch interfaces. The Switch Interfaces menu allows you to define the interaction between the system and the switches connected to it by allowing you to modify switch interface parameters and protocol options for digital interfaces.

Switch Interfaces Hardware

The circuit cards that provide digital interfaces have a unique card number (Card 1, Card 2...Card n) that corresponds to the card slot number. This card number is used in the fields and windows discussed in this chapter.

Accessing the Switch Interfaces Menu

To access the Switch Interfaces menu:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cvvis_menu**

The system displays the Voice System Administration menu ([Figure 84](#)).

Figure 84. Voice System Administration Menu

```
Voice System Administration
Application Package Administration
Backup/Restore
Configuration Management
Feature Packages
Reports
Script Builder Applications
Switch Interfaces
System Monitor
Unix Management
Exit
```

4 Select:

```
> Switch Interfaces
```

5 Press **ENTER**.

The system displays the Switch Interfaces menu ([Figure 85](#)).

Figure 85. Switch Interfaces Menu

Digital Interfaces

Digital interfaces are administered on a card-by-card basis; that is, digital parameters apply to individual digital circuit cards installed in the system.

The digital interfaces currently support the E1/T1 digital circuit card with the following protocols:

- T1 A/B Robbed-bit E&M
- E1 CAS
- ISDN-Primary Rate Interface (PRI)

The process of administering the digital interfaces consists of selecting a protocol based on the circuit card type and either accepting the default values as displayed or changing the default values.

Accessing the Digital Interfaces Menu

The Digital Interfaces menu displays all digital protocols installed on your system. If there are no E1/T1 circuit cards installed in your platform, the Digital Interfaces selection does not appear in the Switch Interfaces menu.

Note: All selected options must match the corresponding options on the switch PBX or network to avoid service problems.

To access the Digital Interfaces menu:

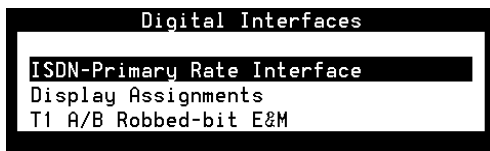

- 1 Start at the Switch Interfaces menu ([Figure 85 on page 143](#)) and select:

```
> Digital Interfaces
```

The system displays the Digital Interfaces menu ([Figure 86](#)).

Figure 86. Digital Interfaces Menu

```
Digital Interfaces
ISDN-Primary Rate Interface
Display Assignments
T1 A/B Robbed-bit E&M
```

Note: [Figure 86](#) displays the installed digital protocol packages. A package must be installed before it is displayed in this menu.

From this menu, you can either display the current digital assignments or select the protocol that you want to administer. Each item in the menu is described in the sections below.

Displaying Digital Interface Assignments

The Display Digital Interface Assignments window displays the E1/T1 circuit cards installed in the voice system and the function to which each is assigned.

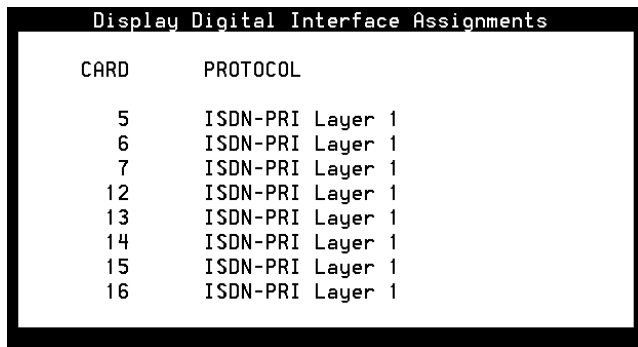

To display the installed E1/T1 circuit cards and their digital protocol assignments:

- 1 Start at the Digital Interfaces menu ([Figure 86 on page 145](#)) and select:

```
> Display Assignments
```

The system displays the Display Digital Interface Assignments window ([Figure 87 on page 147](#)).

Figure 87. Display Digital Interface Assignments

```
Display Digital Interface Assignments
```

CARD	PROTOCOL
5	ISDN-PRI Layer 1
6	ISDN-PRI Layer 1
7	ISDN-PRI Layer 1
12	ISDN-PRI Layer 1
13	ISDN-PRI Layer 1
14	ISDN-PRI Layer 1
15	ISDN-PRI Layer 1
16	ISDN-PRI Layer 1

By default, a circuit card is marked *unassigned*. A protocol must be installed on the voice system before it can be assigned to an E1/T1 card (CWB2).

See “E1/T1 Circuit Cards,” in Chapter 2, “Installing or Replacing Circuit Cards,” in *UCS 1000 R4.2 Maintenance*, 585-313-126, for more information on configuring the CWB2.

[Table 11 on page 148](#) shows the valid parameters and default values for the E1/T1 digital protocols. The procedures in this section detail each protocol and how to set the parameter values for each. Refer to this table as you set the parameters for your protocol.

Table 11. Valid Parameter and Default Values for E1/T1 Digital Protocols

Field Name	Valid Parameter Values	Protocol Name		
		T1 A/B Robbed-bit E&M Default	ISDN-PRI Layer 1	E1 CAS
Framing/ Line Coding	D4ZCS, ESFB8ZS, CEPTHDB3	D4ZCS	ESFB8ZS	CEPTHDB3
DTMF Muting	Yes, No	Yes	Yes	Yes
CSU Distance	0–666 feet	0–133 feet	0–133 feet	—
Wink Time	10–2550 msec	230 msec	—	—
Post Wink Delay ¹	10–2550 msec	80 msec	—	—
Max. Digits in Called Number ¹	0–16	4	—	4
D-channel on This Card?	Yes, No	—	Yes	—
Incoming Speech Volume	0–32000 (-30 to +30 dB)	1414	1414	1414

1 of 2

Table 11. Valid Parameter and Default Values for E1/T1 Digital Protocols

Field Name	Valid Parameter Values	Protocol Name		
		T1 A/B Robbed-bit E&M Default	ISDN-PRI Layer 1	E1 CAS
Outgoing Speech Volume	0–32000 (-30 to +30 dB)	707	707	707
Outgoing Addressing Type	MFC	—	—	MFC
Incoming Addressing Type	MFC	—	—	MFC
Outgoing Text Volume ²	0–32000 (-30 to +30 dB)	1000	1000	1000
A-LAW or MU-LAW	A-LAW, MU-LAW	—	—	A-LAW
CRC	Yes, No	—	—	Yes

2 of 2

1 Applies only to T1 A/B Robbed-bit E&M protocol.

2 Applies only when Text-to-Speech is installed.

T1 A/B Robbed-bit E&M Protocol

Make sure that the switch to which the system is connected is programmed with the following options:

- The T1 interface uses wink start robbed-bit E&M signaling on a link using D4 framing with zero code suppression (ZCS).
- The E1/T1 interface outpulses dual tone multifrequency (DTMF) tones at 7 pulses per second when originating outbound calls and requires DTMF when taking inbound calls.

Accessing T1 A/B Robbed-bit E&M Menu

To access the T1 A/B Robbed-bit E&M menu:

- 1 Start at the Digital Interfaces menu ([Figure 86 on page 145](#)) and select:

```
> T1 A/B Robbed-bit E&M
```

The system displays the T1 A/B Robbed-bit E&M menu ([Figure 88](#)).

Figure 88. T1 A/B Robbed-bit E&M Menu

Assigning T1 A/B Robbed-bit E&M to Digital Circuit Cards

Note: Before a new protocol can be assigned to a circuit card, any existing protocol must first be *unassigned*. See [Unassigning T1 A/B Robbed-bit E&M to Digital Circuit Cards on page 161](#) below for more information.

Before attempting to make any assignment changes to circuit cards, they must be in the MANOOS state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for more information.

If you change digital protocol assignments on the voice system, you must also make the change on the switch.

To assign the T1 A/B Robbed-bit E&M protocol to a digital circuit card:

- 1 Start at the T1 A/B Robbed-bit E&M menu ([Figure 88 on page 151](#)) and select:

```
> Assign Card
```

The system displays the Assign Card: T1 A/B Robbed-bit E&M window ([Figure 89 on page 153](#)).

Figure 89. Assign Card: T1 A/B Robbed-bit E&M Window

```

Assign Card: T1 A/B Robbed-bit E&M

Card Number: █

DTMF Muting: YES
CSU Distance: 0-133 █ ft.
Wink Time: 230 msec.
Post-Wink Delay: 80 msec.
Max. Digits in Called Number: 4 █
Outgoing Addressing Type: DTMF █
Incoming Addressing Type: DTMF █
Outgoing Signaling Type: WINK █
Incoming Signaling Type: WINK █
Incoming Speech Volume: 1414 █
Outgoing Speech Volume: 707 █
Outgoing Text Volume: 1000 █
Idle Code: 11111111 █
A-LAW or MU-LAW: MU-LAW █

```

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the default values for the circuit card number entered.

The `Card Number:` field is blank in [Figure 89](#). After you enter the circuit card number, certain E1-only fields disappear (`Idle Code:`, `A-LAW` or `MU-LAW:`, and `CRC:`).

- 3 Enter **Yes** to enable or **No** to disable in the `DTMF Muting:` field, or press **F2** (Choices) to select from a menu. **Yes** is the default.

Enter **Yes** to use dual-tone multifrequency (DTMF) muting to reduce false DTMF recognitions. Such false recognitions sometimes result from the network echoing back sounds that the voice system falsely recognizes as touchtones.

Enter **No** when the interface is used for bridging; DTMF needs to pass through without muting.

- 4 Enter the cable distance in feet between the Channel Service Unit (CSU) and the voice system in the `CSU Distance:` field, or press **F2** (Choices) to select from a menu. Valid values are 0–133, 134–266, 267–399, 400–533, and 534–666. The default is **0–133**. If there is no CSU, the value entered in this field should be the cable distance between the voice system and the equipment to which it is connected.
- 5 Enter the desired wink time in multiples of 10 between 10 and 2550 milliseconds in the `Wink Time:` field. The default is **230**. This specifies the length of the wink returned to the calling end on incoming calls.
- 6 Enter the desired post-wink delay, in multiples of 10 between 10 and 2550 milliseconds in the `Post-Wink Delay:` field. The default is **80**.
- 7 Enter the number of digits between 0 and 16 that the interface waits for when receiving an incoming call in the `Max. Digits in Called Number:` field. The default is **4**.

- 8 Enter the type of addressing to be used with outgoing calls, either **DTMF**, **MF**, or **DECADIC** in the `Outgoing Addressing Type:` field. The default is **DTMF**.
- 9 Enter the type of addressing to be used with incoming calls, either **DTMF**, **MF**, or **DECADIC** in the `Incoming Addressing Type:` field. The default is **DTMF**.
- 10 Enter the type of signaling to be used with outgoing calls, either **Wink** or **Immediate** in the `Outgoing Signaling Type:` field. The default is **Wink**.
- 11 Enter the type of signaling to be used with incoming calls, either **Wink** or **Immediate** in the `Incoming Signaling Type:` field. The default is **Wink**.
- 12 Enter the volume adjustment for all incoming speech on circuit cards in the `Incoming Speech Volume:` field. Valid values are 0 to 32000. Note that values less than 100 or greater than 8000 may distort the incoming speech. The default is **1414**.

Any adjustment occurs before the system processes the incoming speech for coding it later for playback. The value in the `Incoming Speech Volume:` field represents a gain applied to the speech input using a logarithmic scale. A value of 1000 equals no gain; that is, the input is coded at the same level as it is received. Multiplying by 1.414 (the square root of 2) approximately doubles the input volume, or increases it by 3 dB. Therefore, a value of 1414 in the field doubles the volume of incoming

speech before it is coded, 2000 doubles it a second time, 2828 doubles it a third time, and so on.

To decrease the incoming speech volume, multiply by 0.707 to approximately half the value or decrease it by 3 dB. Therefore, a value of 707 in the field reduces the volume by half, 500 by half a second time, and so on.

See [Table 15 on page 192](#) for the relationship between the volume number and the actual change in volume expressed in decibels.

Note: The incoming speech volume value is set on a per-card basis for digital circuit cards.

- 13 Enter the volume adjustment for all outgoing speech played on the circuit card in the `Outgoing Speech Volume:` field. Valid values range from 0 to 32000. The default is **707**.

The value in this field and its effect are the same as described for the `Incoming Speech Volume:` field. Any adjustment is applied to recorded speech as it is processed for playback.

- 14 (Optional) Enter the outgoing volume of speech in the `Outgoing Text Volume:` field. Valid values are 0 to 32000 (-30 to +30 dB). The default value is **1000**.

Note: This field is displayed only if the optional SSP Text-to-Speech package is installed. This field only applies to SSP Text-to-Speech output volume. The LSPS output volume can not be changed.

15 Ignore the last two fields: Idle Code: and A-LAW or MU-LAW:.

16 Press **F3** (Save).

The system assigns the protocol to the selected circuit card.

Change T1 A/B Robbed-bit E&M Parameters

The circuit card must first be assigned to the T1 A/B Robbed-bit E&M protocol to use this procedure. See [Assigning T1 A/B Robbed-bit E&M to Digital Circuit Cards on page 151](#) for more information about making the initial assignment.

Note: Before attempting to make any assignment changes to circuit cards, they must be in the MANOOS state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for additional information.

If you change digital protocol assignments on the voice system, you must also make the change on the switch.

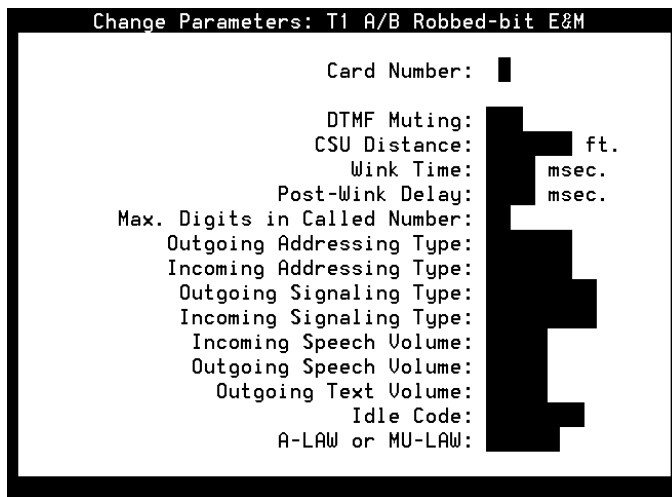

To change the T1 A/B Robbed-bit E&M parameters:

- 1 Start at the T1 A/B Robbed-bit E&M menu ([Figure 88 on page 151](#)) and select:

```
> Change Parameters
```

The system displays the Change Parameters: T1 A/B Robbed-bit E&M window (Figure 90).

Figure 90. Change Parameters: T1 A/B Robbed-bit E&M Window

```
Change Parameters: T1 A/B Robbed-bit E&M

Outgoing Text Volume: █
Idle Code: █
A-LAW or MU-LAW: █
```

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the default values for the circuit card number entered.

The `Card Number:` field is blank in [Figure 90 on page 158](#). After you enter the circuit card number, certain E1-only fields disappear (`Idle Code:`, `A-LAW` or `MU-LAW:`, and `CRC:`).

- 3 Change any of the parameters as described in [Assigning T1 A/B Robbed-bit E&M to Digital Circuit Cards on page 151](#).
- 4 Press **F3** (Save).

The system changes the protocol parameters on the selected circuit card.

Displaying T1 A/B Robbed-bit E&M Parameters

The circuit card must first be assigned to the T1 A/B Robbed-bit E&M protocol to use this procedure. See [Assigning T1 A/B Robbed-bit E&M to Digital Circuit Cards on page 151](#) for more information about making the initial assignment.

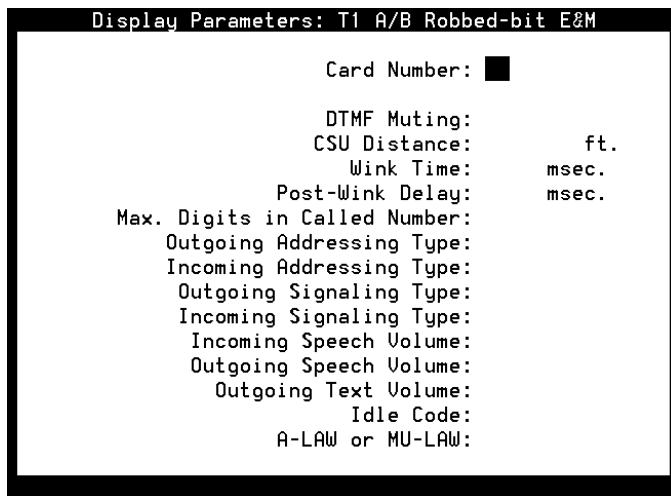

To display the T1 A/B Robbed-bit E&M parameters:

- 1 Start at the T1 A/B Robbed-bit E&M menu ([Figure 88 on page 151](#)) and select:

```
> Display Parameters
```

The system displays the Display Parameters: T1 A/B Robbed-bit E&M window ([Figure 91](#)).

Figure 91. Display Parameters: T1 A/B Robbed-bit E&M Window

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the default values for the circuit card number entered.

The `Card Number:` field is blank in [Figure 91](#). After you enter the circuit card number, certain E1-only fields disappear (`Idle Code:`, `A-LAW` or `MU-LAW:`, and `CRC:`).

The system displays the parameter values for the selected circuit card.

- 3 Press **F6** (Cancel) to return to the T1 A/B Robbed-bit E&M menu.

Unassigning T1 A/B Robbed-bit E&M to Digital Circuit Cards

Note: Before attempting to make any assignment changes to circuit cards, they must be in the MANOOS state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for additional information.

If you also change digital protocol assignments on the voice system, you must make the change on the switch.

To unassign the T1 A/B Robbed-bit E&M protocol to a digital circuit card:

- 1 Start at the T1 A/B Robbed-bit E&M menu ([Figure 88 on page 151](#)) and select:

```
> Unassign Card
```

The system displays the Unassign Card: T1 A/B Robbed-bit E&M window (Figure 92).

Figure 92. Unassign Card: T1 A/B Robbed-bit E&M Screen

```
Unassign Card: T1 A/B Robbed-bit E&M

Card Number: █

```

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu.

The system displays the current parameter values for the selected circuit card.

- 3 Press **F3** (Save).

The system removes the T1 A/B Robbed-bit E&M assignment from the selected circuit card.

- 4 Press **F6** (Cancel) repeatedly to return to the Digital Interfaces menu.

E1 CAS Protocols

The UCS 1000 R4.2 supports the E1 Channel Associated Signaling (CAS) protocol Mexico for use with the DEFINITY switch.

The following CAS protocol is supported with the installation of the corresponding switch integration packages:

- Digital R2 MFC - Mexico

Digital R2 MRC - Mexico Protocol

Accessing Digital R2 MFC - Mexico Menu

To access the E1 CAS for Mexico protocol menu:

- 1 Start at the Digital Interfaces menu ([Figure 86 on page 145](#)) and select

```
> Digital R2 MFC - Mexico
```

The system displays the Digital R2 MFC Protocol - Mexico menu ([Figure 93](#)).

Figure 93. Digital R2 MFC Protocol - Mexico Menu

Use the procedures below to assign or unassign the Digital R2 MFC - Mexico protocol to or from digital circuit cards, and administer the switch interface parameters.

Assigning the Digital R2 MFC - Mexico Protocol to E1 Circuit Cards

Note: Before a new protocol can be assigned to a circuit card, any existing protocol must first be “unassigned.” See [Unassigning the Digital R2 MFC - Mexico Protocol to E1 Circuit Cards](#) below for more information.

Before attempting to make any assignment changes to circuit cards, they must be in the “manoos” state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for additional information.

If you also change digital protocol assignments on the voice system, you must make the change on the switch.

To assign the Mexico protocol to an E1 circuit card:

- 1 Start at the Digital R2 MFC Protocol - Mexico menu ([Figure 93 on page 164](#)) and select:

```
> Assign Card
```

The system displays the Assign Card: Digital R2 MFC Protocol - Mexico window ([Figure 94](#)).

Figure 94. Assign Card: Digital R2 MFC Protocol - Mexico Window

```
Assign Card: Digital R2 MFC Protocol - Mexico

Card Number: █

Framing/Line Coding: CEPTHDB3
Idle Code: 01010100
DTMF Muting: YES
A-LAW or MU-LAW: A-LAW
CRC: YES
Max. Digits in Called Number: 4
Outgoing Addressing Type: MFC
Incoming Addressing Type: MFC
Incoming Speech Volume: 1414
Outgoing Speech Volume: 707
Outgoing Text Volume: 1000
```

- 2 Enter the circuit card number in the **Card Number:** field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the default values for the circuit card number entered.
- 3 Enter the values as shown in [Table 12 on page 167](#) for each of the fields in the window.

Table 12. Parameter Values for Assign Card: Digital R2 MFC - Mexico Window

Field Name	Value
Framing/Line Coding:	CEPTHDB3
Idle Code:	01010100
DTMF Muting:	Yes
A-LAW or MU-LAW:	A-LAW
CRC:	Yes
Max. Digits in Called Number:	4
Outgoing Addressing Type:	MFC
Incoming Addressing Type:	MFC
Incoming Speech Volume:	1414
Outgoing Speech Volume: ¹	707

¹ This field is displayed only if the optional SSP Text-to-Speech package is installed. This field applies only to SSP Text-to-Speech output volume. *The LSPS output volume cannot be changed.*

4 Press F3 (Save).

The system saves the parameter information and assigns the Digital R2 MFC - Mexico protocol to the selected E1 circuit card.

Changing Digital R2 MFC - Mexico Parameters

The E1 circuit card must first be assigned to the Digital R2 MFC - Mexico protocol to use this procedure. See [Assigning the Digital R2 MFC - Mexico Protocol to E1 Circuit Cards on page 164](#) for more information about making the initial assignment.

Note: Before attempting to make any assignment changes to circuit cards, they must be in the “manoos” state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for additional information.

If you change digital protocol assignments on the voice system, you must also make the change on the switch.

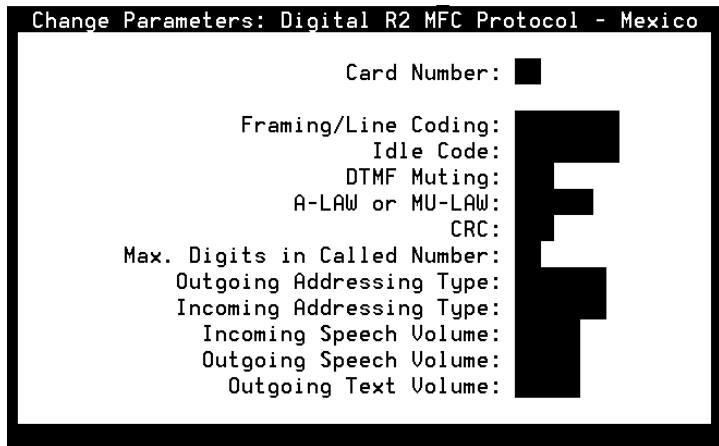

To change the Digital R2 MFC - Mexico parameters:

- 1 Start at the Digital R2 MFC Protocol - Mexico menu ([Figure 93 on page 164](#)) and select:

```
> Change Parameters
```

The system displays the Change Parameters: Digital R2 MFC Protocol - Mexico window ([Figure 95 on page 169](#)).

Figure 95. Change Parameters: Digital R2 MFC Protocol - Mexico Window

- 2 Enter the circuit card number in the **Card Number:** field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the current values for the circuit card number entered.
- 3 Change any of the parameters described in [Assigning the Digital R2 MFC - Mexico Protocol to E1 Circuit Cards on page 164.](#)
- 4 Press **F3** (Save).

The system saves the changed parameters.

Displaying Digital R2 MFC - Mexico Parameters

The E1 circuit card must first be assigned to the Digital R2 MFC - Mexico protocol to use this procedure. See [Assigning the Digital R2 MFC - Mexico Protocol to E1 Circuit Cards on page 164](#) for more information about making the initial assignment.

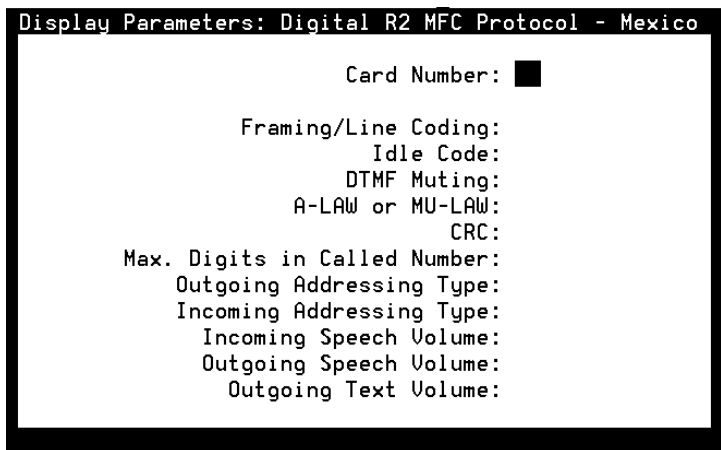

To display the Digital R2 MFC - Mexico parameters of an E1 circuit card:

- 1 Start at the Digital R2 MFC Protocol - Mexico menu ([Figure 93 on page 164](#)) and select:

```
> Display Parameters
```

The system displays the Display Parameters: Digital R2 MFC Protocol - Mexico window ([Figure 96 on page 171](#)).

Figure 96. Display Parameters: Digital R2 MFC Protocol - Mexico Window

- 2 Enter the circuit card number in the **Card Number:** field, or press **F2** (Choices) to select from a menu.

The system displays the parameter values for the selected circuit card.

- 3 Press **F6** (Cancel) to return to the Digital R2 MFC Protocol - Mexico menu.

Unassigning the Digital R2 MFC - Mexico Protocol to E1 Circuit Cards

Note: Before attempting to make any assignment changes to circuit cards, they must be in the “manoos” state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for additional information.

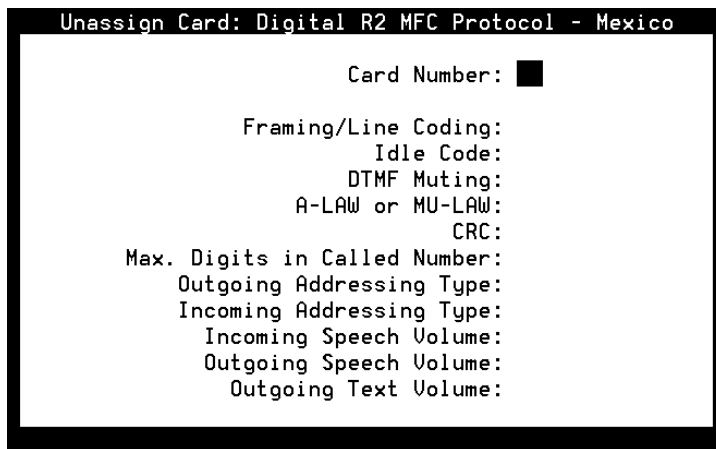

To unassign the Digital R2 MFC - Mexico protocol:

- 1 Start at the Digital R2 MFC Protocol - Mexico menu ([Figure 93 on page 164](#)) and select:

```
> Unassign Card
```

The system displays the Unassign Card: Digital R2 MFC Protocol - Mexico window ([Figure 97 on page 173](#)).

Figure 97. Unassign Card: Digital R2 MFC Protocol - Mexico Window

- 2 Enter the circuit card number in the **Card Number:** field, or press **F2** (Choices) to select from a menu.

The system displays the current parameter values for the selected circuit card.

- 3 Press **F3** (Save).

The system removes the Digital R2 MFC - Mexico protocol assignment from the selected circuit card.

- 4 Press **F6** (Cancel) repeatedly to return to the Digital Interfaces menu.

ISDN-PRI Layer 1 Protocol

Accessing the ISDN-PRI Layer 1 Menu

Note: All selected options must match the corresponding options on the network switch. If they do not, service problems can occur.

To access the ISDN-Primary Rate Interface (ISDN-PRI) Layer 1 menu:

- 1 Start at the Digital Interfaces menu ([Figure 86 on page 145](#)) and select:

```
> ISDN-Primary Rate Interface
```

The system displays the ISDN-PRI Layer 1 menu ([Figure 98 on page 175](#)).

Figure 98. ISDN-PRI Layer 1 Menu

Assigning an ISDN-PRI Layer 1 to Digital Circuit Cards

Note: Before a new protocol can be assigned to a circuit card, any existing protocol must first be *unassigned*. See [Unassigning T1 A/B Robbed-bit E&M to Digital Circuit Cards on page 161](#) for more information.

Before attempting to make any assignment changes to circuit cards, they must be in the MANOOS state. See [Equipment State on page 103](#) in [Chapter 3. Voice System Administration](#), for additional information.

If you change digital protocol assignments on the voice system, you must also make the change on the switch.

To assign the ISDN-PRI Layer 1 to a digital circuit card:

- 1 Start at the ISDN-PRI Layer 1 menu ([Figure 98 on page 175](#)) and select:

```
> Assign Card
```

The system displays the Assign Card: ISDN-PRI Layer 1 window ([Figure 99](#)).

Figure 99. Assign Card: ISDN-PRI Layer 1 Window

```
Assign Card: ISDN-PRI Layer 1

Card Number: █

Framing/Line Coding: ESFB8ZS
DTMF Muting: YES
D-Channel on This Card?: YES
Incoming Speech Volume: 1414
Outgoing Speech Volume: 707
Idle Code: 11111111
A-LAW or MU-LAW: MU-LAW
CSU Distance: 0-133 ft.
CRC: NO
Outgoing Text Volume: 1000
```

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the default values for the circuit card number entered.
- 3 Enter the framing/line coding in the `Framing/Line Coding:` field, or press **F2** (Choices) to select from a menu. The valid values for T1 PRI are **D4ZCS** or **ESFB8ZS**. **ESFB8ZS** is the default.
- 4 Enter **Yes** to enable or **No** to disable in the `DTMF Muting:` field, or press **F2** (Choices) to select from a menu. **Yes** is the default.

Enter **Yes** to use dual-tone multifrequency (DTMF) muting to reduce false DTMF recognitions. These false recognitions sometimes result from the network echoing back sounds that the voice system falsely recognizes as touch tones.

Enter **No** when the interface is used for bridging; DTMF needs to pass through without muting.

- 5 Enter **Yes** or **No** to specify whether the circuit card carries the D-channel in the `D-channel on this Card?:` field, or press **F2** (Choices) to select from a menu.

Up to 13 PRI T1 circuit cards can have a D-channel. The voice system supports up to 13 23B+D interfaces (each with its own D-channel and each set to **Yes** in this field) or up to 311 B+D (where one card has the D-channel and the other twelve cards are controlled by that D-channel and are set to **No** in this field since they do not have a D-channel). The system also supports configurations with 2 to 12 D-channels. Typically, each E1 PRI interface has its own D-channel and the system supports up to three 30B+D interfaces.

- 6 Enter the volume adjustment for all incoming speech on circuit cards in the `Incoming Speech Volume:` field. Valid values are 0 to 32000. Note that values less than 100 or greater than 8000 may distort the incoming speech. The default is **1414**.

Any adjustment occurs before the system processes the incoming speech for coding it later for playback. The value in the `Incoming Speech Volume:` field represents a gain applied to the speech input using a logarithmic scale. A value of 1000 equals no gain; that is, the input is coded at the same level as it is received. Multiplying by 1.414 (the square root of 2) approximately doubles the input volume, or increases it by 3 dB. Therefore, a value of 1414 in the field doubles the volume of incoming speech before it is coded, 2000 doubles it a second time, 2828 doubles it a third time, and so on.

To decrease the incoming speech volume, multiply by 0.707 to approximately half the value or decrease it by 3 dB. Therefore, a value of 707 in the field reduces the volume by half, 500 by half a second time, and so on.

See [Table 15 on page 192](#) for the relationship between the volume number and the actual change in volume expressed in decibels.

Note: The incoming speech volume value is set on a per-card basis for digital circuit cards.

- 7 Enter the volume adjustment for all outgoing speech played on the circuit card in the `Outgoing Speech Volume:` field. Valid values range from 0 to 32000. The default is **707**.

The value in this field and its effect are the same as described for the `Incoming Speech Volume:` field. Any adjustment is applied to recorded speech as it is processed for playback.

CAUTION:

The `Idle Code:`, `A-LAW` or `MU-LAW:`, and `CRC:` field parameters must match the settings on the switch to avoid service complications.

- 8 (E1 only) Enter the 8-digit code that are generated when the channel is idle in the `Idle Code:` field.
- 9 (E1 only) Enter **A-LAW** or **MU-LAW** in the `A-LAW` or `MU-LAW:` field.

- 10 Enter the cable distance, in feet, between the Channel Service Unit (CSU) and the voice system in the `CSU Distance:` field, or press **F2** (Choices) to select from a menu. Valid values are 0–133, 134–266, 267–399, 400–533, and 534–666. The default is **0–133**. If there is no CSU, the value entered in this field should be the cable distance between the voice system and the equipment to which it is connected.
- 11 (E1 only) Enter **Yes** to enable the cyclical redundancy check error checking or **No** to disable the error checking in the `CRC:` field.
- 12 (Optional) Enter the outgoing volume of speech in the `Outgoing Text Volume:` field. Valid values are 0 to 32000 (-30 to +30 dB). The default is **1000**.

Note: This field is displayed only if the optional SSP Text-to-Speech package is installed. This field only applies to SSP Text-to-Speech output volume. The LSPS output volume can not be changed.

- 13 Press **F3** (Save).

The system saves the parameter information and assigns the ISDN-PRI Layer 1 protocol to the selected E1/T1 circuit card.

PRI Layer 2 and Layer 3 Parameters

Your PRI service provider may need to know some Layer 2 and Layer 3 parameters used by the voice system. [Table 13](#) and [Table 14 on page 182](#) provide a list of the most commonly requested parameters. Incoming calls to the voice system should be provisioned so that the channel number is exclusive and not preferred.

If the switch is configured to deliver ANI on a subscription basis, it is not possible for the voice system to request a different type of ANI on a call-by-call basis.

While it is not recommended to change timer values from their defaults, the **/vs/man/cat4/pri.rc.4** manual page describes how PRI timer values and a few other parameters can be changed if that becomes necessary.

Table 13. PRI Layer 2 Parameters

Layer 2 Parameter	Value
Retry Count N200	3
Timer T200	1 seconds
Timer T203	30 seconds

Table 14. PRI Layer 3 Parameters

Layer 3 Parameter	Value (seconds)
Timer T302	15
Timer T303	4
Timer T305	4
Timer T308	4
Timer T310	10
Timer T313	4
Timer T316	120
Timer T3M1	120
Timer T309	30

Changing ISDN-PRI Layer 1 Card Parameters

The circuit card must first be assigned to the ISDN-PRI Layer 1 protocol to use this procedure. See [Assigning an ISDN-PRI Layer 1 to Digital Circuit Cards on page 175](#) for more information about making the initial assignment.

Note: Before attempting to make any assignment changes to circuit cards, they must be in the MANOOS state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for additional information. If you change digital protocol assignments on the voice system, you must also make the change on the switch.

To change the ISDN-PRI Layer 1 parameters:

- 1 Start at the ISDN-PRI Layer 1 menu ([Figure 98 on page 175](#)) and select:

```
> Change Parameters
```

The system displays the Change Parameters: ISDN-PRI Layer 1 window ([Figure 100](#)).

Figure 100. Change Parameters: ISDN-PRI Layer 1 Window

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the default values for the circuit card number entered.
- 3 Change any of the parameters as described in [Assigning an ISDN-PRI Layer 1 to Digital Circuit Cards on page 175](#).
- 4 Press **F3** (Save).

The system changes the specified parameters for the selected circuit card.

Displaying ISDN-PRI Layer 1 Parameters

The circuit card must first be assigned to the ISDN-PRI Layer 1 protocol to use this procedure. See [Assigning an ISDN-PRI Layer 1 to Digital Circuit Cards on page 175](#) for more information about making the initial assignment.

To display the ISDN-PRI Layer 1 parameters:

- 1 Start at the ISDN-PRI Layer 1 menu ([Figure 98 on page 175](#)) and select:

```
> Display Parameters
```

The system displays the Display Parameters: ISDN-PRI Layer 1 window (Figure 101).

Figure 101. Display Parameters: ISDN-PRI Layer 1 Window

```
Display Parameters: ISDN-PRI Layer 1

Card Number: ■

Framing/Line Coding:
DTMF Muting:
D-Channel on This Card?:
Incoming Speech Volume:
Outgoing Speech Volume:
Idle Code:
A-LAW or MU-LAW:
CSU Distance:          ft.
CRC:
Outgoing Text Volume:
```

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu. Initially, all fields are populated with the default values for the circuit card number entered.

The system displays the parameter values for the selected circuit card.

- 3 Press **F6** (Cancel) to return to the ISDN-PRI Layer 1 menu.

Unassigning ISDN-PRI Layer 1 Card

Note: Before attempting to make any assignment changes to circuit cards, they must be in the MANOOS state. See [Equipment State on page 103](#) in [Chapter 3, Voice System Administration](#), for additional information. If you change digital protocol assignments on the voice system, you must also make the change on the switch.

To unassign the ISDN-PRI Layer 1 protocol to a digital circuit card:

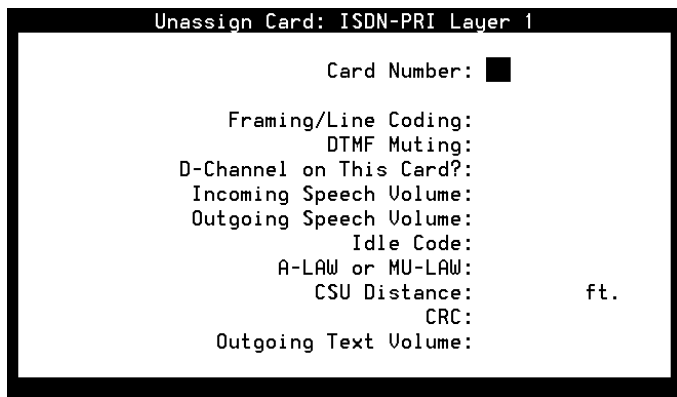

- 1 Start at the ISDN-PRI Layer 1 menu ([Figure 98 on page 175](#)) and select:

```
> Unassign Card
```

The system displays the Unassign Card: ISDN-PRI Layer 1 window ([Figure 102 on page 187](#)).

Figure 102. Unassign Card: ISDN-PRI Layer 1 Window

- 2 Enter the circuit card number in the `Card Number:` field, or press **F2** (Choices) to select from a menu.

The system displays the current parameter values for the selected circuit card.

- 3 Press **F3** (Save).

The system removes the ISDN-PRI Layer 1 assignment from the selected circuit card.

- 4 Press **F6** (Cancel) repeatedly to return to the Digital Interfaces menu.

T1 for 4ESS Applications

The following options should be used when connecting a the system to a 4ESS switch via an E1/T1 line when using the E&M protocol.

Note: Some parameters on the switch side may require that you stop and restart the voice system once you have made changes. For example, when changing the frame format from D4ZCS to ESF, your PRI link to the switch may not come up if you have not stopped and started the voice system. See [Stopping the Voice System on page 90](#) and [Starting the Voice System on page 93](#) in [Chapter 3, Voice System Administration](#), for the procedures.

- T1 E&M Options

The following options should be set on the E1/T1 circuit card when it is connected to an AT&T 4ESS switch:

- ~ Wink Timing: 230 msec
- ~ Maximum Digits in Called Number: 4 is typical
- ~ Post-wink Delay: 80 msec
- E1/T1 E&M Fixed Parameters:
 - ~ Framing/Line Coding: D4/ZCS
 - Signaling: A or AB Robbed-bit E&M protocol

- Incoming/Outgoing Start Dialing: wink/wink
- Incoming/Outgoing Addressing: DTMF/DTMF
- ~ Timing Source: Looped Timed
- 4ESS Options

The following information is requested by AT&T when provisioning the 4ESS switch for an E1/T1 connection:

- ~ TYPE CPE: DIGITAL PBX/ACD (WITH DS1 INTERFACE)
 - 4E NETWORK SWITCHED BASED SERVICES: MEG (Megacom), MEG8 (Megacom 800), or MULTIQUEST* as desired
 - ACCESS TYPE: T1
 - TRUNK OPERATION: The voice system always allows two-way traffic. If you expect only incoming calls, it is recommended that you select 1W/IN TOWARDS CPE. If you expect only outgoing calls, it is recommended that you select 1W/OUT FROM CPE. If you expect two-way traffic, select 2WAY.
 - SUPERVISION: EM
 - ADDRESS SIGNALING (TYPE OF PULSING) TO CPE: DTMF(TT)
 - ADDRESS SIGNALING TT DELAY: 70MS
 - ADDRESS SIGNALING from CPE: DTMF(TT)

- START DIAL SIGNALING PROVIDED BY CPE: WK
- START DIAL SIGNALING PROVIDED TO CPE: WK (senderized operation)
- CPE DOES NOT SUPPORT DIFFERENT SIGNALING BIDIRECTIONALLY
- NUMBER OF DIGITS OUTPULSED TO CPE: This number should match the number selected in the "Maximum Digits in Called Number" E1/T1 option
- THE CPE CAN ACCEPT "O" AS THE FIRST DIGIT
- GLARE CONTROL: CPE WILL YIELD (WILL RELEASE)
- DIRECT INWARD DIAL (DID): N
- PBX ANSWER SUPERVISION WITHHELD: N
- NETWORK AUTHORIZATION CODES: N
- FRAME FORMAT: D4
- IS PBX SENDERIZED: YES
- CPE TIMING CAPABILITY: loop timed
- SOURCE OF SYNCHRONIZATION PROVIDED BY CPE: NONE
- SOURCE OF AUDIBLE RINGING ON CALLS TO CPE: PBX (CPE)

Changing Switch System Parameters

To change the switch system parameters:

Note: You must stop the voice system before changing the switch system parameters.

- 1 Start at the Switch Interfaces menu ([Figure 85 on page 143](#)) and select:

```
> Change Switch System Parameters
```

The system displays the Change Switch System Parameters window ([Figure 103](#)).

Figure 103. Change Switch System Parameters

```
Change Switch System Parameters

DTMF Connection Tone: C
DTMF Disconnection Tone: D
Background Output Volume: 33
Number Rings to Wait for DNIS: 2
Hunt Group Method: ascending
```

- 2 Change the field values using the information in [Table 15](#) and [Table 16 on page 193](#).

Table 15. DTMF Tone Table

Keys on the Telephone Keypad			Corresponding DTMF Tone
1	2	3	A
4	5	6	B
7	8	9	C
*	0	#	D

Table 16. Switch System Parameters

Field Name	Description	Valid Values
Background Output Volume:	This parameter specifies the adjustment to the output volume level in percent for the speech being played in the background.	A numeric entry for the percentage
Hunt Group Method:	This parameter specifies the order of hunting for idle channels.	Ascending (default), descending, or random Press F2 (Choices) to select from a menu.

3 Press **F3** (Save).

The system displays the message that the switch system parameters have been changed.

4 Press **F1** to acknowledge the message.

5 Press **F6** (Cancel) to return to the Switch Interfaces menu.

6 [Starting the Voice System on page 93](#) as described in [Chapter 3, Voice System Administration](#).

Displaying Switch System Parameters

The Display Switch System Parameters window allows you to view the current setting for the switch system parameters.

To display the switch system parameters:

Note: You must stop the voice system before changing the switch system parameters.

- 1 Start at the Switch Interfaces menu ([Figure 85 on page 143](#)) and select:

```
> Display Switch System Parameters
```

The system displays the Display Switch System Parameters window ([Figure 104 on page 195](#)).

Figure 104. Display Switch System Parameters Window

```
Display Switch System Parameters

DTMF Connection Tone: C
DTMF Disconnection Tone: D
Background Output Volume: 33
Number Rings to Wait for DNIS: 2
Hunt Group Method: ascending
```

- 2 Press **F6** (Cancel) to return to the Switch Interfaces menu.

5 Database Administration

Overview

This chapter provides information and procedures on how to administer ORACLE databases for use with the voice system. The information in this chapter is applicable *only* if you have the ORACLE 7 software installed on your system.

This chapter includes procedures for determining database space requirements, sizing the databases, and administering database tables. This chapter also reviews the SQL*PLUS software program, a tool used to access the ORACLE database.

Databases and the Voice System

Databases are used by the voice system to access various types of data, depending on the application. However, the information in this chapter focuses on ORACLE databases used to store and retrieve call data.

The information in databases is arranged into *tables*. The following section describes the database tables associated with call data.

Call Data Tables

The base ORACLE software package creates the following database tables to store call data ([Table 17](#)).

Note: All these tables are created and owned by the sqlplus user *sti/sti*.

Table 17. ORACLE Call Data Tables

Table Name	Table Description
CCA	Call classification analysis data (contains one record for each attempted transfer or outdial).
CCASUM	Summary data for the CCA table (contains one record per hour, telephone number, and result code).
CALL ¹	Basic call information (contains one record per call).
SERVICE	Basic service information (contains one or more service records per call).
CDHSUM	Summary data for the CALL and SERVICE tables (contains one record per hour and service).

1 of 2

Table 17. ORACLE Call Data Tables

Table Name	Table Description
EVENTS	Event data defined for a service (contains one record per event). There can be more than one EVENTS records per SERVICE record.
EVSUM	Summary data for the EVENTS table (contains one record per hour and event number).
TRASUM	Overall traffic summary data (contains one record per hour and channel).

2 of 2

1 The CALL and SERVICE tables replace the CDH table. Since more than one service (application) may be running during a call, there may be multiple entries in the SERVICE table related to a single entry in the CALL table. A database view named OLDCDH, consisting of fields from the CALL and SERVICE tables, has been created to represent the old CDH table.

The voice system provides four reports that use the data accumulated in these tables. See [Chapter 7, Common Administration](#), for procedures showing how to display, modify, print, and update the available reports.

CCA Table

The CCA table contains the following information:

- **START_TIME** is a date field that specifies the starting time of each attempted transfer or outdialed call.
- **PHONE_NUM** is a variable-length character field that specifies the telephone number of an attempted transfer or outdialed call. This field can be up to 16 characters in length.
- **RESULT_CODE** is a variable-length character field that indicates the disposition of the call. This field can be 1 or more characters in length.

CCASUM Table

The CCASUM table contains the following information:

- **PHONE_NUM** is a variable-length character field that specifies the telephone number of an attempted transfer or outdialed call. This field can be up to 16 characters in length.
- **START_TIME** is a date field that specifies the starting time of the call summary period.
- **END_TIME** is a date field that specifies the ending time of the call summary period.

- SUM_TOT is a numeric field that indicates the number of calls transferred or outdiald in this period with this disposition and associated telephone number.
- RESULT_CODE is a variable-length character field that indicates the disposition of the call. This field can be 1 or more characters in length.

Note: Records are generated on a per-hour, per-telephone number, and per-result_code basis.

CALL Table

The CALL table contains the following information:

- CID is a numeric field that specifies a unique identification number that joins one CALL.CID to multiple SERVICE.CID.
- CHANNEL is a positive numeric field that specifies the channel number on which the call was running. This field can be up to 3 digits in length.
- START_TIME is a date field that specifies the starting time of each call.
- END_TIME is a date field that specifies the ending time of each call.

SERVICE Table

The SERVICE table contains the following information:

- CID is a numeric field that specifies a non-unique identification number that joins multiple SERVICE.CID to one CALL.CID.

Each call creates one or more SERVICE records, depending on the number of services used to handle the call. All SERVICE records associated with a call have the same SERVICE.CID as the CALL.CID in the CALL record. See [Relationship Between the CALL, SERVICE, and EVENT Tables on page 204](#).

- SID is a numeric field that specifies a unique identification that joins one SERVICE.SID to multiple EVENTS.SID.
- SERVICE is a variable length character field that specifies the service (application) name. This field can be up to 16 characters in length.
- START_TIME is a date field that specifies the starting time of each service.
- END_TIME is a date field that specifies the ending time of each service.

CDHSUM Table

The CDHSUM table contains the following information:

- SUMID is a numeric field that specifies a unique identification number that joins CDHSUM.SUMID to EVSUM.SUMID.
- SERVICE is a variable-length character field that specifies the service (application) name. This field can be up to 16 characters in length.
- START_TIME is a date field that specifies the start of the hour (for example, 10:00:00).
- DURATION is a numeric field that specifies the sum of service run times during this hour in seconds.
- USAGE is a numeric field that indicates the total number of times the service was run for calls during a 1-hour period.

Note: Records are generated on a per-hour and a per-service basis.

EVENTS Table

The EVENTS table contains the following information:

- SID is a numeric field that specifies a nonunique identification number.

Note: Each service run during a call creates a certain number of event records, depending on the number of events defined. All events

records associated with this call have the same SID number as the SID field of the corresponding SERVICE record.

See [Relationship Between the CALL, SERVICE, and EVENT Tables on page 204](#) for more information.

EVSUM Table

The EVSUM table contains the following information:

- SUMID is a numeric field that specifies a unique identification number.

Note: The values in this field are related to the SUMID values in the CDHSUM table.

- EVENT_NUMBER is a numeric field that specifies the internal mapping between the event and an internal number.
- SUM_TOT is a numeric field that indicates the total number of occurrences for this event.

Note: If the event type is a numeric, the value in SUM_TOT is the sum of the values of this event field for all the calls. For example, if an event field, NUM_TRANS, keeps track of the number of transactions for each call, SUM_TOT contains the sum of NUM_TRANS for all calls during this time period. On the other hand, if the event type is not a number, each call increments SUM_TOT by one.

TRASUM Table

The TRASUM table contains the following information:

- START_TIME is a date field that specifies the start of hour (for example, 10:00:00).
- CHANNEL is a numeric field that indicates the channel number. This field can be up to 3 digits in length.
- CALL_TOT is a numeric field that specifies the total number of calls.
- DUR_TOT is a numeric field that specifies the total duration in seconds.

Note: Records are generated on a per-hour and a per-channel basis. No calls during this hour on this channel result in no record.

OLDCDH View

The OLDCDH view is an ORACLE database view provided to be compatible with the CDH table that is not supported in newer releases.

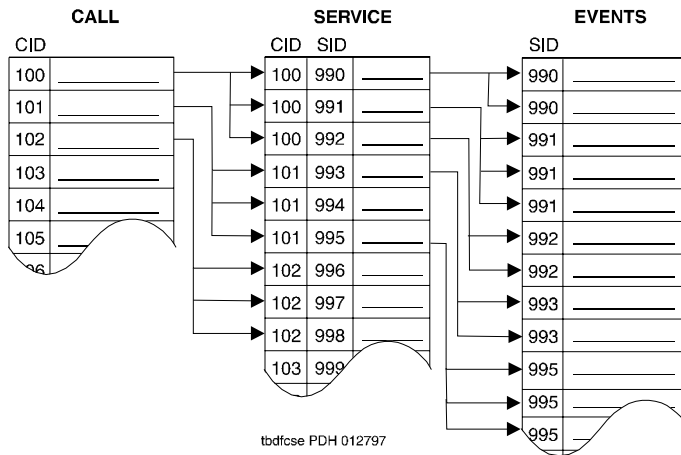

Relationship Between the CALL, SERVICE, and EVENT Tables

The relationship between these three call data handling tables is summarized by the following statements and in [Figure 105 on page 205](#):

- Each telephone call creates one record in the CALL table.

- Each record in the CALL table is linked to one or more records in the SERVICE table.
- Each record in the SERVICE table is linked to zero or more records in the EVENTS table.

Figure 105. Relationship Between the CALL, SERVICE and EVENTS Tables

Resizing Call Data Tables

The sizes of the call data handling tables are defined in the [/oracle/dist/cdh/sql](#) file. Although the sizes are carefully engineered, it is possible that one or more of the tables should be increased to accommodate the heavier traffic on your system or the greater number of events defined in your applications. The most likely candidates for resizing are the EVENTS, SERVICE, and CALL tables, and their index tables.

To increase the size of a call data table:

- 1 At the `Console Login`: prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cd /oracle/dist**

The system changes to the **oracle/dist** directory.

- 4 Enter **cp cdh.sql o.cdh.sql**

The system saves the original copy of the **cdh.sql** file to a file named **o.cdh.sql**.

- 5 Enter **dbused**

The system displays the number of megabytes used by the table.

- 6 Write down this number.
- 7 Use the UNIX editor *vi* to modify the **cdh.sql** file as follows:
 - a Find the `create table xxx` statement block, where *xxx* is the table name (for example, CALL, SERVICE or EVENTS).
 - b Modify the statement `storage (initial 999k)` to a bigger number, where *999* is the current initial size for the table and *k* stands for kilobytes (1024 bytes).

Note: The new values specified should be at least twice as large as the current table size you wrote down in [step 6](#). You may use the megabyte format, *99m*, where *m* is mbytes (1,000,000 bytes = mbyte). For example, to make the table have an initial size of 3 mbytes, modify the storage statement to read:

storage (initial 3m)

- 8 Enter **stop_vs**

The systems stops the voice system. See [stop_vs](#) in [Appendix A, Summary of Commands](#) for more information about the **stop_vs** command.

Note: If you do not want to preserve existing call data, skip [step 9](#) through [step 11](#).

9 Enter **systblsav** *file*

The system saves the table storage information, where *file* is a UNIX file or a device name where the data will be saved, such as, **/dev/rmt/c0s0**.

10 Enter **sqlplus \@ /oracle/dist/cdh.sql**

The system reinitializes the table or tables.

11 Enter **systblres** *file*

The system restores the table storage information from the UNIX file or device name where it was saved in [step 9](#), such as, **/dev/rmt/c0s0**.

12 Enter **start_vs**

The system restarts the voice system. See [start_vs](#) in [Appendix A, Summary of Commands](#) for more information about the **start_vs** command.

Verify Call Data Tables

Periodically, the field definitions of a table need to be reviewed for accuracy, or to assist with troubleshooting.

To verify the field definitions of a table (such as, the CCA table):

1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

2 Enter your root password.

The system displays the system prompt #.

3 Enter **sqlplus sti/sti**

The system starts a sqlplus session.

4 Enter **describe CCA**

Note: If the table name is lowercase, do not use the **describe** command. Instead, use **desc** as described below:

desc table_name

The system displays the current definition of the CCA table, similar to the following:

Name	Null?	Type
-----	-----	-----
START_TIME	DATE	
PHONE_NUM	VARCHAR2(16)	
RESULT_CODE	VARCHAR2(1)	

5 Enter **quit**

The system exits the sqlplus session.

Table Searches

Think of a database table as a book. If you want to find information on a subject, you must search the book to find it. However, checking the index first helps you to locate the information in the book much more quickly than paging through the book. The same is true for finding data in a database table.

Indexes and Key Fields

For large databases, you can use indexes on key fields to greatly reduce the time necessary to search the tables.

Indexed fields can be especially important in applications that require a “lookup” from a large table based on user input. This input generates a SQL statement for accessing the database that has the following form:

```
SELECT * from “table_name” where “FIELD1” = ‘data’;
```

If FIELD1 has an index created for it in the database, all records that match the criteria specified in the select statement are located much faster than if there is no index.

FIELD1 is a key field in this example because it is the field used to specify selection criteria. Indexes only decrease read time when they are created on key fields.

A SQL statement may have more than one key field, as in the following example:

```
SELECT * from "table_name" where "FIELD1" = 'data1' AND "FIELD2" = 'data2';
```

In this example, FIELD1 and FIELD2 are key fields. Create an index for each of these fields to enhance system performance.

Unique Indexes

Unique indexes on fields enforce uniqueness of the data in that field across the entire table of records. For example, a field for which you might create a unique index is one that contains a social security number (SSN). A unique index on an SSN field ensures that only one record with a given SSN can exist in the table. Attempts to add records with that SSN will fail.

Use the following procedure to create a unique index on a field called *FIELD1* in a table called *"table_name"*:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **sqlplus sti/sti**

The system starts a sqlplus session.

- 4 Enter
create unique index *index_name* on *table_name* ("FIELD1");

The system creates a unique index for FIELD1 in the table.

Non-Unique Indexes

Non-unique indexes do not prevent the same data from appearing in that field in several records in the same table. For example, if a field contains the area code of a telephone number and an index is created for that field, it must be a non-unique index since other records may require the same number in their area code field.

Use the following procedure to create non-unique indexes on fields called *FIELD1* and *FIELD2* in a table called *table_name*:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **sqlplus sti/sti**

The system starts a sqlplus session.

- 4 Enter **create index *index_name* on *table_name* ("FIELD1");**

The system creates a non-unique index for FIELD1 in the table.

- 5 Enter **create index *index_name* on *table_name* ("FIELD2");**

The system creates a non-unique index for FIELD2 in the table.

Database Interface Process

A voice system application accesses the database tables through a single database interface process (DIP). A DIP is a software program that connects to the database and provides the only interface between the application and the database.

Database DIP Timeout

The voice system and remote database ORACLE connection is established when the voice system starts. After the connection is established, the voice system does not keep track of status changes on the remote machine. The connection between it and the voice system is dropped if the remote machine is turned off or rebooted. If the remote machine is shut down and rebooted while the voice system is still active, the voice system detects this status change only when calls come in to the system that involve remote database access for call processing. The voice system attempts to reestablish the remote connection and is not able to process calls during this time.

In certain cases, the database DIP (**oraldb**) may not receive a timely response from the machine. This may be due to a variety of factors, such as

the machine not operating, the machine operating slowly, an application query of a large non-indexed table, network congestion, and so on.

While the DIP is waiting for a response from the machine, the message queue of the DIP may back up. A full message queue (the current maximum is 255) may result in performance problems for the voice system.

To prevent this, the DIP is equipped with a timeout mechanism. By default, the DIP times out every 45 seconds while waiting for a response. After the timeout, the DIP deletes the messages currently queued and continues to wait for a response from the database. The DIP continues to time out every 45 seconds and to empty the message queue. After the default of 300 seconds, the DIP automatically respawns and reinitializes.

The 45-second and 300-second timeout values can be altered in ***/vs/data/ldb dip.rc*** file. This file is included with the generic package and contains the following default values:

```
FIRST_TMOUT=45
SECOND_TMOUT=300
```

You can change these default values to any number that is appropriate for your database and applications. If the **ldb dip.rc** file is missing, the DIP uses the default timeout values of 45 seconds and 300 seconds.

CAUTION:

Always stop the voice system before shutting down the remote database machine to avoid an unexpected interruption of service.

Database Cursors

An internal data structure called a *database cursor* is used to monitor the point from which the DIP is reading in a specific database table. One cursor is allocated for each read of each database table by each channel running a service that requires access to that database. The cursor remains assigned to that table until the service ends on the channel for which the cursor was allocated.

The number of cursors is tunable in the **/oracle/dbs/initA.ora** file (*open_cursors* is a tunable parameter). At least 500 cursors are supported. Once the limit of cursors is reached, database transactions do not complete successfully. That is, table reads may fail and inserts or updates may not occur.

Database Cursor Calculations

To ensure the integrity and consistency of the data in the database, you must keep this limiting factor in mind when you design your applications. Use the following formula to determine the number of database tables that may be accessed by an application with the voice system:

$$\text{channel} \times \text{read} \times \text{cursor} < 500$$

where:

~ channel = the number of channels running applications with database access

- ~ read = the number of read table operations performed on different tables by applications (per channel)
- ~ cursor = the number of cursors involved in the read table

Note: Multiple reads of the same table use only one cursor.

The following are sample calculations using various configurations and numbers of read table operations.

- If you have a 24-channel system running an application that performs four read table operations on four different tables per channel, the calculation is:

$$24 \times 4 \times 1 = 96$$

Since 96 is less than 500, the database operations proceed properly.

- If you have a 36-channel system running an application that performs four read table operations on a single table per channel, the calculation is:

$$36 \times 1 \times 1 = 36$$

Since 36 is less than 500, the database operations proceed properly.

- If you have a 48-channel system running an application with five read table operations on five different tables per channel, the calculation is:

$$48 \times 5 \times 1 = 240$$

In this case, if all 48 channels are performing five read table operations, some database operations may fail because of the multiple read table operations on the same channels.

- An application developer wants to develop an application that executes six read table operations on six different tables per channel:

$$500 / (6 \times 1) = 83.33$$

Therefore, the application can run on as many as 80 channels before it encounters database access problems.

- An application developer wants to develop an application to run on 72 channels simultaneously:

$$500 / (72 \times 1) = 6.94$$

Therefore, the application can perform up to six read table operations on up to six different tables per channel before it encounters database access problems.

Increasing Database Storage Size

The amount of storage space needed for the database should be decided at the initial installation because the size of the database can affect the disk partition sizes (the database is stored in the **oracle** file system).

To increase the database size:

Note: It is not necessary to stop the voice system while you are resizing the database.

1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

2 Enter your root password.

The system displays the system prompt #.

3 Enter **/vs/bin/util/dbfrag**

The system displays the number of free database blocks.

4 Multiply the number of free database blocks by 4 to get the actual number of free 512-byte blocks.

5 Enter **df /oracle**

The system displays the number of free blocks available in the **/oracle** file system.

6 Determine the number of bytes to add to the database by subtracting the current database size (in blocks) from the optimum size.

7 Enter **/oracle/bin/svrmgrl**

The system enters the system manager mode.

8 Enter **connect internal**

9 Enter **alter tablespace system**

10 Enter **add datafile '/oracle/dbs/dbsA2.dbf'**

Note: The file name *dbmA2.dbf* is a recommended name. If this file already exists in this directory, use *dbmA3.dbf*

11 Enter **size number**

where *number* is the number of bytes calculated in [step 6](#) that you want to add to the database.

12 Enter **exit**

Note: We recommend that you use the above commands as written. However, if you are concerned about the **/oracle** file system size, substitute the **add datafile '/home2/dbsA2.dbf'** command for **add datafile '/oracle/dbs/dbsA2.dbf'** above.

13 Enter **/vs/bin/util/dbfrag**

The system displays the number of free database blocks.

14 Check that the database size has been increased as desired.

15 Enter **exit**

The system exits the system manager mode.

16 Enter **exit**

Decreasing the Database Storage Size

To minimize database storage and access problems, the voice system provides two ways to minimize the storage space required for call data:

- Reduce the amount of call data stored.
- Reduce the number of days for which data is stored.

Reducing the Amount of Call Data Stored

You can decrease the amount of database space needed by reducing the number of stored call data events. This reduction must be accomplished at the application design level. Unlike the technique to reduce the number of days data is stored, there are no system variables to modify. This minimization technique involves modifying every application that stores call data events to store fewer of them.

Reducing the Number of Days Data is Stored

Another way to minimize the amount of storage required for call classification and call data detail information is to store fewer than 7 days worth of data. The voice system knows how many days worth of data to archive by reading the contents of the **croncdh** file in the **/vs/bin/util** directory.

The following is a sample **croncdh** file:

```
# Start the ORACLE DBMS

VSUTIL=/vs/bin/util
ORACLE_SID=A;export ORACLE_SID
ORACLE_HOME='/usr/lbin/dbhome $ORACLE_SID'
PATH=$PATH:$ORACLE_HOME/bin;export PATH
ulimit 2113674
if /usr/lbin/orastat -s >/dev/null

then
:

else
  ulimit 2113674; ior w
fi

# perform the cron jobs

$VSUTIL/cdhsum
$VSUTIL/cdhdel
$VSUTIL/ccasum
$VSUTIL/ccadel

# cleanout the unwanted ORACLE log files
$VSUTIL/logdel
```

Changing the Data Storage Number of Days

Currently, the only report produced for the call classification data is the Call Classification Summary report. Therefore, saving zero days worth of call classification data saves database space without affecting the reports produced by the voice system. Storing zero days worth of data means that only the call classification data for the current day is available until the clean-up and summary programs run each night after midnight. The voice system always maintains the current day's data.

To change the number of data days, modify the following commands in the **croncdh** file, where **x** is the number of days of data to store:

```
$VSUTIL/cdhdcl -x  
$VSUTIL/ccadel -x
```

Note: If **cdhdcl** and **ccadel** do not have any arguments, the default of 7 days is used, as illustrated in the sample **croncdh** file above.

To store 2 days worth of call detail data information, and 4 days of call classification data, modify the **croncdh** file as follows:

```
# Start the ORACLE DBMS  
  
VSUTIL=/vs/bin/util  
ORACLE_SID=A;export ORACLE_SID  
ORACLE_HOME='/usr/lbin/dbhome $ORACLE_SID';export  
ORACLE_HOME  
PATH=$PATH:$ORACLE_HOME/bin;export PATH
```

```
if /usr/sbin/orastat -s >/dev/null
then
:
else
  ulimit 2113674; ior w
fi

# perform the cron jobs

$VSUTIL/cdhsum
$VSUTIL/cdhdel -2
$VSUTIL/ccasum
$VSUTIL/ccadel -4

# cleanout the unwanted ORACLE files
$VSUTIL/logdel
/vs/bin/util/dbcheck -w 15,20
```

Increasing the Shared Pool Size

Perform this procedure to allocate additional memory resources for ORACLE. You may need to do this if the system is trying to write to several database tables at once and you receive the ORACLE error message number ORA-04031 in the message log.

Note: This procedure increases the amount of main memory that ORACLE uses.

- 1 Check the message log for ORA-04031. The text portion of this message indicates there is not enough shared memory space.
- 2 Access the **/oracle/dbs/initA.ora** file.
- 3 Place a pound sign (#) in front of the value `shared_pool_size=3500000`.
- 4 Remove the pound sign (#) from the front of the value `shared_pool_size=6000000`.
- 5 Save and exit the file.
- 6 Enter **/oracle/bin/ior c** to stop the database system.
- 7 Enter **/oracle/bin/ior w** to start the database system.

Rollback Segment

A rollback segment is a storage buffer that records actions that can be undone under certain circumstances. The rollback segment grows as needed as long as there is available space in the database. However, the rollback segment does not automatically decrease in size, and some ORACLE operations can cause the rollback segment to grow dramatically. Consequently, you might want to restore the rollback segment to the original size by first eliminating it, and then recreating it.

The installation of the Base ORACLE software package creates one rollback segment called **R1**.

This section provides information on verifying and reducing the size of this rollback segment.

Verifying or Reducing the Size of the Rollback Segment

Note: The procedure to *reduce the size* of the R1 rollback segment requires that the voice system and the database system be stopped. If possible, avoid reducing the size of the rollback segment when call traffic is heavy. The procedure to verify the size of the rollback segment does not require that the voice system and the database system be stopped. Consequently, you may verify the size of the rollback segment at any time.

To verify or reduce the size of the rollback segment:

1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **/vs/bin/util/rb_init** to display the current size of the rollback segment, R1.

The system displays a message similar to the following:

```
Rollback segment R1 is currently 653312 bytes in size, would
you like to reduce the size of this rollback segment? (y/n)
```

The original size of the rollback segment was set to 653312 bytes. If the current size is close to this number, or if it is less than one-fourth of your total database size, you do not need to reduce the size of the rollback segment.

To terminate this procedure, go to [step 4](#).

To continue with this procedure and reduce the size of the rollback segment, go to [step 5](#).

- 4 To terminate the **rb_init** command without reducing the size of the rollback segment, enter **n**

The system returns to the system prompt #. You have completed this procedure.

- 5 Enter **y** to reduce the size of the rollback segment.

The system executes the **rb_init** command. The system displays the following message If the voice system is running:

```
The voice system is running. Is it OK to stop the voice
system? (y/n)
```

- 6 Enter **y** to shut down the voice system and continue with the procedure to reduce the size of the rollback segment.

The system displays the following message if the database system is running:

```
The database system is running. Is it OK to shutdown the
database? (y/n)
```

- 7 Enter **y**

The system stops the database system and executes the **rb_init** command.

When the **rb_init** command is finished, the system displays the following message:

```
Would you like to restart the voice system? (y/n)
```

- 8 Enter **y** to restart the voice system, or enter **n** to wait to start the voice system.

If you do not want to restart the voice system and the database at this point, you may do so manually at a later time.

Voice System Database Administration

To access the Database Administration window:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cvis_menu**

The system displays the Voice System Administration menu ([Figure 106](#)).

Figure 106. Voice System Administration Menu

```
Voice System Administration
Application Package Administration
Backup/Restore
Configuration Management
Feature Packages
Reports
Script Builder Applications
Switch Interfaces
System Monitor
Unix Management
Exit
```

4 Select:

```
> Configuration Management
> Database Administration
```

The system displays the Database Access ID Table window ([Figure 107](#)).

Figure 107. Database Access ID Table Window

Database Access ID Table		
DATABASE ACCESS ID	REMOTE/DESCRIPTOR	DB SID
DB1_local	-	-

Press CHG-KEYS to ADD or REMOVE a Database Access ID.
Press CANCEL to exit.

Database Access ID Table Window

The Database Access ID Table window displays currently recognized database IDs. Use the Database Access ID Table window to perform the following tasks:

- Add a local or remote database access ID
- Remove a local or remote database access ID

[Table 18](#) describes each field in the Database Access ID Table window.

Table 18. Field Descriptions for the Database Access ID Table Window

Field Name	Description
Database Access ID	List of database access IDs, each representing an established ORACLE database connection to the system. See Database Access IDs on page 231 for more information.
Remote Machine ¹	Remote machine name.
DB SID ¹	Database instance, ORACLE_SID or database name (dbname) on ORACLE systems. There could be multiple instances on a remote machine.

¹ If these fields are blank, the connection is to a local ORACLE database. If these fields are populated, the connection is to an ORACLE database on the system or to an ORACLE database on the machine specified in the Remote Machine field.

Database Access IDs

Each ID listed in the Database Access ID Table window represents an established local or remote connection to an ORACLE database. This connection is used by the voice system's applications to access a customer's database tables. The database ID, then, represents each local or remote database to the voice system.

An application can access multiple database tables in a local database (that is, a database that resides on the voice system's hard disk). However, you can improve the access performance by adding multiple database access IDs to that local database to split the access evenly between the multiple database access IDs.

Adding a Local Database Access ID

To add a *local* database access ID:

- 1 Start at Database Access ID Table window ([Figure 107 on page 229](#)).
- 2 Press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 3 Press **F1** (Add).

The system displays the Add A Database Access ID menu ([Figure 108 on page 232](#)).

Figure 108. Add A Database Access ID Menu

```
      Add A Database Access ID
>Add A Local Database Access ID
  Add A SQL*Net V2 Remote Database Access ID
```

4 Select:

```
> Add a Local Database Access ID
```

The system displays the Add a Local Database Access ID window ([Figure 109](#)).

Figure 109. Add a Local Database Access ID Window

```
Add a Local Database Access ID
Database Access ID: _____
```

5 Enter the local database access ID in the Database Access ID: field, or press **F2** (Choices) to select from a menu. Valid values are DB2_local, DB3_local, DB4_local, and DB5_local.

DB1_local is the standard connection to a local ORACLE database. The CHOICES menu lists only those local database access IDs that have not yet been added.

- 6 Press **F3** (Save) to save the database access ID and exit the window. The Add a Database Access ID menu remains active, allowing you to add other database access IDs, if desired.
- 7 If you are finished adding database access IDs, press **F6** (Cancel) twice to return to the Configuration Management menu.
- 8 Stop and start the voice system. See [Stopping the Voice System on page 90](#) and [Starting the Voice System on page 93](#) in [Chapter 3, Voice System Administration](#), for the procedures.

The system establishes the local database connections.

Adding a Remote Database Access ID Using SQL*NET V2

You must have the SQL*NET TCP/IP installed on your system to use SQL*NET V2 for remote database access.

See “Installing the Oracle SQL*NET TCP/IP Package,” in Chapter 7, “Installing the Optional Feature Software,” in *UCS 1000 R4.2 Maintenance*, 585-313-126, for information on installing the SQL*NET V2 software.

Before you establish an SQL*NET V2 connection, verify that the following are true:

- The SQL*Net V2 listener for TCP/IP is running on the remote database server.

- The `$ORACLE_HOME/network/admin/tnsnames.ora` configuration file on the UCS 1000 R4.2 has been updated to provide system information for the system. The system software automatically attempts to update the existing `tnsnames.ora` file (or to create a new file if none exists), but manual alterations are sometimes necessary. For assistance with this requirement, see the database administrator.

See “Configuring the TNS Listener: LISTENER.ORA” and “Identifying the Servers: TNSNAMES.ORA” in the *ORACLE Server Administrator’s Guide Release 7.3*, for more information on these configuration files.

To add a remote database access ID using SQL*NET V2:

- 1 Start at Database Access ID Table window ([Figure 107 on page 229](#)).
- 2 Press **F8** (Chg–Keys).

The system displays the alternate set of function keys.

- 3 Press **F1** (Add).

The system displays the Add a Database Access ID menu ([Figure 110](#)).

Figure 110. Add a Database Access ID Menu

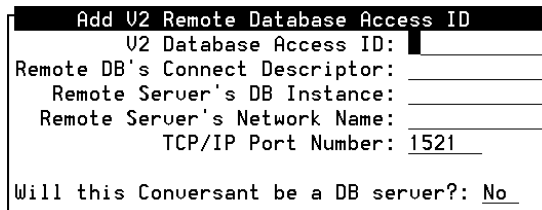

```
      Add A Database Access ID
Add A Local Database Access ID
>Add A SQL*Net V2 Remote Database Access ID
```

4 Select:

```
> Add a SQL*Net V2 Remote Database Access ID
```

The system displays the Add V2 Remote Database ID window ([Figure 111](#)).

Figure 111. Add V2 Remote Database Access ID Window

```

Add V2 Remote Database Access ID
V2 Database Access ID: 
Remote DB's Connect Descriptor: 
Remote Server's DB Instance: 
Remote Server's Network Name: 
TCP/IP Port Number: 1521 

Will this Conversant be a DB server?: No_

```

5 Complete the fields in this window using the information in [Table 19](#).

Table 19. Field Descriptions for the Add V2 Remote Database Access ID Window

Field Name	Description	Valid Values
V2 Database Access ID:	This field specifies the name by which you want to refer to this connection.	—
Remote DB's Connect Descriptor:	This field specifies the database instance on the remote database server to which you want to connect. This connect descriptor is put into the /oracle/network/admin/tnsnames.ora file if it is not already in that file.	—
Remote Server's DB Instance:	This field specifies the name of the ORACLE database instance on the remote database server. This field is also known as the ORACLE SID.	This name must match the corresponding ORACLE SID on the server system. Contact the server's database administrator for this name.

1 of 3

Table 19. Field Descriptions for the Add V2 Remote Database Access ID Window

Field Name	Description	Valid Values
Remote Server's Network Name:	This field specifies the network name or TCP/IP address of the remote database server. If the network name is entered, it must already exist in the local /etc/hosts file.	Contact the network administrator for this name or TCP/IP address.
TCP/IP Port Number:	This field contains the TCP/IP port number.	This port number must match the one on the remote database server. Contact the server's database administrator for this port number.

2 of 3

Table 19. Field Descriptions for the Add V2 Remote Database Access ID Window

Field Name	Description	Valid Values
Will this CONVERSANT be a DB server?	<p>This field indicates whether this is a database server.</p> <p>Note: It is strongly recommended that the local system not be used as a database server due to performance considerations.</p>	<p>Yes or No</p> <p>If No, the system can only be a client to a remote database server.</p> <p>If Yes, the system can be both a client and a database server. Also, if Yes, the system sets up a listener process and a connect descriptor entry is created in the tnsnames.ora file for this system.</p>
3 of 3		

6 Press **F3** (Save).

The system saves the information and redisplay the Database Access ID Window.

7 Press **F6** (Cancel) twice.

The system closes the Database Access ID Table.

- 8 Stop and start the voice system. See [Stopping the Voice System on page 90](#) and [Starting the Voice System on page 93](#) in [Chapter 3, Voice System Administration](#), for the procedures.

Completing ORACLE Environment Setup if Server is Not a UCS 1000 R4.2

If the database server is a UNIX-based system running ORACLE V7 but not a UCS 1000 R4.2 system, you must perform the following procedures to complete the ORACLE environment setup:

Note: This procedure assumes the following:

- ~ The network is a TCP/IP local area network and consists of a single server and any number of clients (UCS 1000 R4.2 systems).
 - ~ The server runs a single listener process to permit access to the server's database.
 - ~ The ora7sql package is installed on all of the clients
 - ~ The entries for the server and for all of the clients are in the **/etc/hosts** file on the server and all of the clients.
 - ~ All remote database files are created and/or updated on the server.
 - ~ Files can be remotely copied from the server to all clients.
- 1 Administer the SQL*NET V2 product so that the listener process can be launched.

- 2 Start the listener process.
- 3 Provide the server's network name and database instance name (ORACLE_SID) to each UCS 1000 R4.2 client system.

Accessing a Remote Database Using PRO*C or SQL*PLUS

The following are application development issues related to accessing a remote database using PRO*C or SQL*PLUS programs.

Setting the Connect Descriptor

If you are using PRO*C or SQL*PLUS with an IRAPI application, you must change or verify the correct form of the connect string. The database interface assigns the node name of the system with the remote database as the connect string. The connect string should be in the form "*remote_system*" with the name of the system contained in quotes. For example, if the remote system name is cop3, the connect string must be "cop3".

Setting Environment Variables

If you are using PRO*C, you must set the environment variables ORACLE_HOME and ORACLE_SID. Two methods are available:

- Shell wrapper approach
- putenv function call

Shell Wrapper Approach

Perform the following:

- 1 Compile the original source file that communicates with the database along with all the other source files.
- 2 Rename the executable file using the move command, but keep it in the same directory.
- 3 Using your favorite editor, edit a file with the same name as the original executable file.
- 4 Enter the following on the first line:

```
ORACLE_SID=ORACLE_SID_name;export ORACLE_SID
```

where *ORACLE_SID_name* is the name of the instance of the ORACLE database on the server.

- 5 Enter the following on the second and third lines:

```
ORACLE_HOME='/usr/lib/dbhome $ORACLE_SID';export  
ORACLE_HOME  
exec new_executable_file_name
```

where *new_executable_file_name* is the full path name of the newly-renamed executable file.

- 6 Save the file and exit the editor.

- 7 Change the mode of shell file with the original name to `rwxr_xr_x`.
- 8 Add the original executable file name along with all the other executable files to `/etc/inittab` file as before using the same tools as before.

The following example is used to illustrate these steps. The executable file that communicates with the database is called **get_pin_uac**. The name of the instance of the ORACLE database is "A".

- 1 Compile the **get_pin_uac** executable file along with all the other executable files as before.
- 2 Enter **mv get_pin_uac getPinUac** in the `/home/gar/irapi` directory.
- 3 In the `/home/gar/irapi` directory, enter **vi get_pin_uac**
- 4 Enter the following first line to the file:
ORACLE_SID=A;export ORACLE_SID
- 5 Add the following second and third line to the file:
**ORACLE_HOME='/usr/lib/dbhome \$ORACLE_SID';export
ORACLE_HOME
exec /home/gar/irapi/getPinUac**
- 6 Save the file and exit the editor.
- 7 Enter **chmod 755 get_pin_uac**

- 8 Place the **/home/gar/irapi/get_pin_uac** entry along with all the other executable files in the **/etc/inittab** file as before using the same tools as before.

putenv Approach

The following describes the putenv approach. The putenv function call permits the developer to directly place the ORACLE_SID and the ORACLE_HOME environmental shell variables into a Pro*C program. Perform the following:

- 1 Using an editor, open the Pro*C source file for editing.
- 2 Add the following line at the top of the source file:

```
#include <stdlib.h>
```

- 3 Near the beginning of main, add the following two lines of code:

```
putenv ( "ORACLE_SID=<ORACLE_SID_name>" );
```

```
putenv ( "ORACLE_HOME=<ORACLE_HOME_name>" );
```

where *ORACLE_SID_name* is the name of the database instance on the server and *ORACLE_HOME_name* is the ORACLE_HOME directory on the server.

- 4 Recompile this source code file along with all the source files that make up the custom software.

The following example is used to illustrate these steps. The name of the instance of the ORACLE database is "A". The name of the ORACLE_HOME directory is **/oracle**.

```
/* start of header files */
...
#include <stdlib.h>
...
/* end of header files */
...
...
main (argc,argv)
int argc;
char *argv[];
{
    /* start of local variables */
    ...
    /* end of local variables */
    /* start of executable code */
    /* start of putenv changes */
    putenv ( "ORACLE_SID=A" );
    putenv ( "ORACLE_HOME=/oracle" );
    /* end of putenv changes */
    ...
    ...
}
```

Removing a Database Access ID

The Remove a Database Access ID window allows you to remove one or more existing database access IDs, thereby dropping the connection to the associated ORACLE database.

CAUTION:

When you remove a remote database access ID, make sure that no applications use that database access ID. If an application uses an ID that has been removed, the application fails when it tries to access data stored in that database.

1 Start at Database Access ID Table window ([Figure 107 on page 229](#)).

2 Press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

3 Press **F2** (Remove).

The system displays the Remove a Database Access ID window ([Figure 112 on page 246](#)).

Note: DB1_local represents the standard connection to the local ORACLE database and cannot be removed. There must always be at least one connection to the local database.

Figure 112. Remove a Database Access ID Window

4 Enter the access ID of the database you want to remove in the `Database Access ID:` field, or press **F2** (Choices) to select from a menu.

5 Press **F3** (Save).

The system saves the ID of the remote database connection to be deleted.

6 Stop and start the voice system. See [Stopping the Voice System on page 90](#) and [Starting the Voice System on page 93](#) in [Chapter 3, Voice System Administration](#), for the procedures.

The system removes the database connection.

SQL*PLUS Database Administration

The SQL*PLUS software program is a tool used to access the ORACLE RDBMS. It is included in the Base ORACLE software package. This tool can be used to review database information without having to access the voice system directly.

 **CAUTION:**

Do not alter any data, schema, logins, or passwords using SQL*PLUS. Doing so may corrupt the voice system and result in the need for maintenance. The ORACLE right-to-use license is restricted solely to UCS 1000 R4.2 applications, that is, not covered under the warranty.

If you use SQL*PLUS to drop a table or change a table schema, you must reverify and reinstall the application that refers to the table. The applications might not be able to communicate with the database correctly if you fail to reverify and reinstall them.

Monitoring the Database

See the *ORACLE Server Administrator's Guide* for information on commands and procedures used to monitor the database.

Database Commands

The following commands may be used to monitor database space utilization. See the information under the command name in [Appendix A, Summary of Commands](#).

The dbcheck Command

The **dbcheck** command checks space usage and rollback segment growth.

dbcheck Command Options

The **dbcheck** command has three different options:

- **-i** installs **cron** entries and error messages. The **cron** job can be placed in either the **root cron** file or added to the end of **/vs/bin/util/croncdh** job that runs once a day. The **-i** option also asks if you want new error messages added to the **att** errors file along with explanations used with the **explain** command. This installation only needs to be run if you want the warnings to show up in the system message log or you want to schedule automatic checking at regular intervals.
- **-r** removes any cron entry set up by the **-i** option
- **[-w n[,m]][-s][-e][-m user[~user...]]** checks database space against user-set thresholds. The following occurs:
 - ~ Free space is checked against the user set threshold **n**, 15% default
 - ~ Rollback segment growth is checked against the user set threshold **m**, 20% default

When executed, the **dbcheck** command generates the appropriate warnings (see below) if the database falls below **n** percent free or if the rollback segments grow to be more than **m** percent of the total database size.

The command, by default, sends warning messages to the error log indicating a threshold was exceeded (the `-i` option must be run first). The `-e` option disables entries from going into the log file. The `-s` option prints the warning messages to standard output. The `-m` user option allows for the messages to be mailed to `user`. Multiple users can be sent the mail by separating the user names with a tilde (~). Following are sample outputs:

(Output to error log when less than 13% available or more than 23% used by rollback)

```
# dbcheck -w13,23
```

dbcheck Command Output

The **dbcheck** program returns the following values:

- 0 — Success (no limits exceeded)
- 1 — Threshold exceeded
- 2 — Processing error
- 3 — Database is not running

The dbfree Command

The **dbfree** command is a shell script that lists the amount of free space in the database by free contiguous blocks. The result will be a detailed listing of each free memory area followed by the sum of each tablespace. The free blocks listed are in 2048 bytes per block (ORACLE blocks). There is also a column that lists the same information in megabytes.

dbfree Command Options

The **-h** option removes the column headers.

The dbfree Command Output

The **dbfree** program returns the following values:

- 0 — Success
- 1 — Processing error

The dbfrag Command

The **dbfrag** command is a shell script that reports on database allocation, usage, and fragmentation. The block size reported is in ORACLE blocks (2048 bytes). This command is useful to get a quick check on database usage and provides a shell interface into some key ORACLE statistics. This command only reports on information in the SYSTEM tablespace.

The dbfrag Command Options

The dbfrag command has two options:

- **-b** reports the information in megabytes.
Example: **# dbfrag -b**
- **-h** prints the listing without a header. This option is useful if you want to parse the output to select a specific field.

The dbfrag Command Output

The **dbfrag** program returns the following values:

- 0 - Success
- 1 - Processing error

The dbused Command

The **dbused** command is a shell script that displays the amount of space used by each object for a given user. Objects are tables, indexes, clusters, rollback, and cache. The default user is sti/sti.

dbused Command Options

The **dbused** command has three options:

- **-h** prints the listing without a header. This option is useful if you want to parse the output to select a specific field.
- **-s** produces only summary information grouped by objects.
- **-u uid/passwd** specifies the ORACLE user id and password (sti/sti is default) for all users.

dbused Command Output

The **dbused** program returns the following values:

- 0 - Success
- 1 - Processing error

Database Trace Files

ORACLE creates a trace file in the **/oracle/rdbms/log** directory each time the system is rebooted. These trace files are not automatically removed by ORACLE and must be removed by the user or administrator if the files are no longer wanted. In addition, ORACLE creates a log file **/oracle/tcp/log/orasrv.log** that contains all of the remote login information that is automatically created and appended by ORACLE. This log file is not automatically removed by ORACLE and may be removed or truncated by the user or administrator.

6 Peripheral Administration

Overview

This chapter provides the information and procedures needed to configure and administer the peripheral equipment connected to your voice system, namely modems, printers, and remote terminals.

Accessing the Unix Management Menu

To access the Unix Management menu:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

3 Enter `cvvis_menu`

The system displays the Voice System Administration menu ([Figure 113](#)).

Figure 113. Voice System Administration Menu

```
Voice System Administration
Application Package Administration
Backup/Restore
Configuration Management
Feature Packages
Reports
Script Builder Applications
Switch Interfaces
System Monitor

Exit
```

4 Select:

```
> Unix Management
```

The system displays the Unix Management menu ([Figure 114](#)).

Figure 114. Unix Management Menu

```
UNIX Management
>Removable Media Operations
  Modem/Terminal Administration
  Printer Administration
  Equinox Administration
  UNIX Date and Time
```

The procedures in this chapter detail administration for modems, terminals, and printers.

The other menu options in the UNIX Management menu are discussed in [Chapter 7, Common Administration](#).

Modem Administration

This section describes the procedures to configure and administer a 3820 or 3920 Plus modem for use with your voice system.

Installing the Modem

To install the modem:

- 1 Physically connect the modem to the system.

See “Connecting the 3820 Modem to the Platform,” in Chapter 4, “Completing System Installation,” in *UCS 1000 R4.2 New System Installation*, 585-313-127, for the procedure to physically connect the modem.

Configuring the Modem

In order for the 3820 or 3920 plus modem to work properly with the voice system, you must configure the modem using one of the two following methods:

- Configure the modem via its control panel after connecting it to the COM port on the hardware platform. See [Configuring the Modem Using the Modem Control Panel on page 257](#) for more information.
- Connect the modem to a terminal that acts as a DTE and configure the modem via the terminal. See [Configuring the Modem Using a Terminal on page 264](#) for more information.

Configuring the Modem Using the Modem Control Panel

The 3820 and 3920 Plus modems have a Diagnostic Control Panel (DCP) that is the user interface to the modem. Use the procedures below to configure the 3820 modem via its control panel:

Activate the Unix Dial Default Factory Configuration

To activate the UNIX Dial default factory setting:

- 1 Turn the modem off and then back on.
- 2 Press  or  on the modem to display `Configure`.
- 3 Press the function key under `Configure` (**F1** or **F2**).

Modem response:

```
Ld EditArea frm.
```

- 4 Press  or  to display `Factory`.
- 5 Press **F1** to display the factory preset configuration.

Modem response:

```
LD Fact Preset:
```

- 6 Press  or  to display `Unix Dial`.

7 Press **F2** (Select).

Modem response:

```
Choose Function  
Edit and Save.
```

8 Press **F3** (Save).

Modem response:

```
Sav EditArea to  
Active.
```

9 Press **F1** (Save).

~ 3820 modem response:

```
Command Complete
```

~ 3920 Plus modem response after a power reset.

```
Idle: 288
```

10 Press  to return to the top-level menu.

Setting the Async DTE Rate

To set the Async DTE rate to the required speed:

- 1 Press **◀** or **▶** on the modem to display `Configure`.
- 2 Press the function key under `Configure` (**F1** or **F2**).

Modem response:

```
Ld EditArea frm.
```

- 3 Press **◀** or **▶** to display `Active`.
- 4 Press **F1** (Save).

Modem response:

```
Choose Function  
Edit and Save
```

- 5 Press **F1** (Edit).

Modem response:

```
Edit StrapGroup  
DTE Interface
```

- 6 Press **F1** (Edit).

Modem response:

```
Async/Sync Mode
```

7 Press **F1** (Next) to display `Async DTE Rate`.

8 Press **◀** or **▶** to display the baud.

9 Press **F2** (Select).

The LCD displays the baud.

10 Continue with the next procedure, [Setting the DTR Action and DSR Control to Standard RS-232 on the Modem on page 260](#). Do *not* return to the top-level menu.

Setting the DTR Action and DSR Control to Standard RS-232 on the Modem

To set the DTR action to standard RS-232 on the modem:

1 Press **F1** (Next), more than once if necessary, to display `DTR Action`.

2 Press **◀** or **▶** to display `Stndrd_RS-232`.

3 Press **F2** (Select).

4 Press **F1** (Next) to display `DSR Control`.

5 Press **◀** or **▶** to display `Stndrd_RS-232`.

6 Press **F2** (Select).

- 7 Press the single **▲**.

Modem response:

```
Edit StrapGroup
```

- 8 Press **◀** or **▶** to display DTE Dialer.

- 9 Press **F1** (Edit).

Modem response:

```
DTE Dialer Type
```

- 10 Press **F1** (Next) to display AT Escape Char.

- 11 Use **◀** or **▶** and **F2** (Select) to adjust the number to 128 ASCII.

- 12 Press **▲**.

Modem response:

```
Edit StrapGroup
```

- 13 Press **◀** or **▶** to display Dial Line.

- 14 Press **F1** (Edit).

Modem response:

```
Dial Line Rate
```

- 15 Press **◀** or **▶** to display baud.

- 16 Press **F2** (Select).

The LCD displays the baud.

- 17 Press the single .

Modem response:

```
Edit StrapGroup
```

- 18 Continue with the next procedure, [Setting the Error Control Mode to Buffer Mode on the 3820 Modem on page 262](#). Do *not* return to the top-level menu.

Setting the Error Control Mode to Buffer Mode on the 3820 Modem

To set the error control mode to buffer mode:

- 1 Press  or  to display V42/MNP/Buffer.

- 2 Press **F1** (Edit).

Modem response:

```
Err Control Mode
```

- 3 Press  or  to display BufferMode.

- 4 Press **F2** (Select).

- 5 Press **F1** (Next) to display Flw Cntl of DTE.

6 Press  or  to display CTS_to_DTE.

7 Press **F2** (Select).

8 Press .

Modem response:

```
Edit StrapGroup
```

9 Press .

Modem response:

```
Choose Function
```

```
Edit and Save
```

10 Press **F3** (Save).

Modem response:

```
Sav EditArea to
```

```
Active
```

11 Press **F1**.

Modem response:

```
Command Complete
```

12 Press  to return to the top-level menu.

Configuring the Modem Using a Terminal

To configure the modem terminal:

- 1 Connect a terminal to the 3820 modem.

Note: See the documentation provided with the terminal for connection instructions.

- 2 Verify that the terminal is acting as a DTE.
- 3 Set the terminal line to 8 bits, no parity, and 1 stop bit.
- 4 Set the baud of the terminal line to the required modem speed.
- 5 Enter **AT** from the terminal.

Modem response:

OK

Note: If the modem does not display OK, the modem is unable to accept AT commands from the terminal. Check the connection and the terminal setup.

- 6 Enter

AT&F3L0&D2&S1\N0\Q3S41=*dial line rate*S2=128&W0

where *dial line rate* is one of the following bauds:

- ~ 3 = 9600
- ~ 5 = 4800

- ~ 6 = 2400
- ~ 7 = 200, V.22
- ~ 8 = 1200, 212A
- ~ 20 = 19200

For example, to set the 3820 modem to use COM1, where the baud is 19200, enter **20** as the *dial line rate* as shown below:

AT&TF3L0&D2&S1\N0\Q3S41=20S2=128&W0

Modem response:

OK

- 7 Disconnect the terminal.
- 8 Connect the modem to COM port 1.

Note: COM port 2 (COM2) is reserved for the TAM.

The system activates the RTS, CTS, and LSD indicators.

Administering the Modem

For the 3820 or 3920 plus modem to work properly with the voice system, you must administer the voice system to recognize the modem port.

To administer the voice system to recognize the modem:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cvvis_menu**

- 4 Select

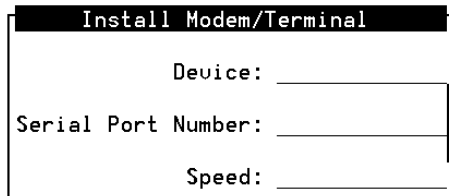

```
> UNIX Management
```

```
> Modem/Terminal Administration
```

```
> Install Modem/Terminal Software
```

The system displays the Install Modem/Terminal window ([Figure 115](#)).

Figure 115. Install Modem/Terminal Window

- 5 Enter **modem** in the `Device:` field.
- 6 Press **F2** (Choices) to display a list of valid port numbers for the `Serial Port Number:` field.
 - a Select COM port 1, **/dev/tty00**

Note: COM port 2 (COM2) is reserved for the TAM.

- 7 Enter **19200** in the `Speed:` field.
- 8 Press **F3** (Save).

The system displays a confirmation window.

- 9 Press **F6** (Cancel) to finish and return to the Modem/Terminal Installation menu.

Setting Up UnixWare to Use a Modem for Outgoing Calls

To configure UnixWare for a modem:

- 1 Start at the UNIX System V Administration menu ([Figure 17 on page 24](#)) and select:

```
> network services
> basic networking
> devices
> add
```

The system displays the Adds a Device for Use by Basic Networking window ([Figure 116](#)).

Figure 116. Adds a Device for Use by Basic Networking Window

```
5 Adds a Device for Use by Basic Networking
Device category: Modem _____
```

- 2 Enter **Modem** in the Device category: field, or press **F2** (Choices) to select from a menu. The default is **Modem**.

- 3 Press **F3** (Save).

The system displays the Add a Modem Device for use by Basic Networking (1) window ([Figure 117](#)).

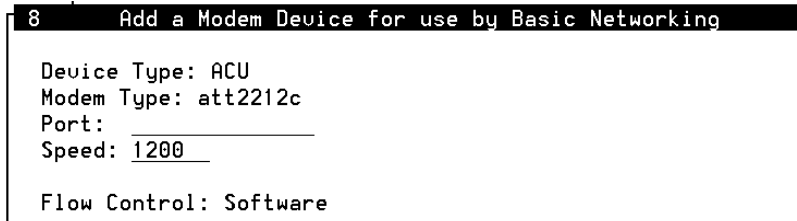

Figure 117. Add a Modem Device for use by Basic Networking (1) Window

- 4 Enter **ACU** in the Device Type: field.
- 5 Enter the appropriate modem in the Modem Type: field, or press **F2** (Choices) to select from a menu. If your modem uses the “atdt” command set, select one of the Hayes modems.
- 6 Press **F3** (Save).

The system displays the Add a Modem Device for use by Basic Networking (2) window (Figure 118) with several of the fields already filled in.

Figure 118. Add a Modem Device for use by Basic Networking (2) Window

```
8 Add a Modem Device for use by Basic Networking
Device Type: ACU
Modem Type: att2212c
Port:
Speed: 1200
Flow Control: Software
```

7 Enter **/dev/tty00** for COM port 1.

Note: COM port 2 (COM2) is reserved for the TAM.

8 Enter **19200** in the `Speed:` field, or accept the default.

9 Press **F3** (Save).

The system displays the following message:

```
Entry was added to the system. Use Ports menu to add a port
monitor for a bidirectional port.
```

Setting Up UnixWare to Use a Modem for Incoming Calls

To configure UnixWare for a modem that can process incoming calls:

- 1 Start at the UNIX System V Administration menu ([Figure 17 on page 24](#)) and select:

```
> ports
```

```
> port_monitors
```

```
> add
```

The system displays the Add A Port Monitor window ([Figure 119](#)).

Figure 119. Add A Port Monitor Window

```
4 Add A Port Monitor

Port monitor tag: _____
Port monitor type: _____
Command to start the port monitor:
_____
Version number: ____
Start port monitor immediately? Yes
Start state: ENABLED Restart count: 0

(Optional fields)
File name of the port monitor configuration script:
_____
Comments:
_____

Fill in the form and then press SAVE.
```

- 2 Enter **ModemMon** in the Port monitor tag: field.
- 3 Enter **ttymon** in the Port monitor type: field.
- 4 Enter **/usr/lib/saf/ttymon** in the Command to start the port monitor: field.
- 5 Enter **2** in the Version number: field.

- 6 Enter **Yes** in the `Start port monitor immediately:` field.
- 7 Enter **Enabled** in the `Start state:` field.
- 8 Enter **0** in the `Restart count:` field.
- 9 Press **F3** (Save).

The system displays the Service Access Management menu ([Figure 120](#)).

Figure 120. Service Access Management Menu

```
2 Service Access Management
>port_monitors - Port Monitor Management
port_services - Port Service Management
quick_terminal - Quick Terminal Setup
tty_settings - Terminal Line Setting Management
```

10 Select:

```
> port services
```

```
> add
```

```
> add to one
```

```
> ModemMon
```

The system displays the Add Port Services to Port Monitor window (Figure 121).

Figure 121. Add Port Services to Port Monitor Window

```
6          Add Port Services to Port Monitor (inet          Page 1 of 2
Service tag: _____
Identification & authentication scheme:
_____

Port/service state: ENABLED
utmp entry to be created for this service? No
Version number: ____

(Optional fields)
  File name of the port service configuration script:
_____
  Comments:
_____

Fill in the form and then press [SAVE] to continue on page 2.
```

- 11 Enter **Modem** in the Service Tag: field.
- 12 Enter **login** in the Identification & Authentication Scheme: field.
- 13 Leave the Service invocation identity: field blank.
- 14 Enter **ENABLED** in the Port/service State: field.

15 Enter **YES** in the `utmp` entry to be created for this service: field.

16 Enter **2** in the `Version number:` field.

Leave the remaining fields blank.

17 Press **F3** (Save).

The system displays the Add Port Services for `ttymon` window ([Figure 122](#)).

Figure 122. Add Port Services for `ttymon` Window

```
7 Add Port Services for ttymon Page 2 of 2
Name of TTY device: /dev/<serial port>
ttylabel: 19200
Service command: /usr/bin/shserv
TTY line options:
  Hangup: No Connect-on-carrier: No
  Bidirectional: Yes Wait-read: Yes (Wait-read count: 0)
Timeout: 0
Prompt message: login
(Optional fields)
  Modules to be pushed: ldterm
  Disabled response message:

Fill in the form and then press [SAVE].
```

- 18 Enter **/dev/tty00** in the Name of TTY device: field.
- 19 Enter **19200** in the ttylabel: field.
- 20 Enter **/usr/bin/shserv** in the Service command: field.
- 21 Enter **No** in the Hangup: field.
- 22 Enter **No** in the Connect-in-Carrier: field.
- 23 Enter **Yes** in the Bidirectional: field.
- 24 Enter **No** in the Wait-read Count: field.
- 25 Enter **0** in the Timeout: field.
- 26 Enter **login:** in the Prompt Message: field.
- 27 Enter **ldterm** in the Modules to be Pushed: field.
- 28 Leave the Disabled Response Message: field blank.
- 29 Press **F3** (Save).

The system saves the configuration information and displays the following message:

```
Service <tty00s> is added successfully.
```

- 30 Press **F3** (Cont).

The system returns to the Port Service Management menu ([Figure 123](#)).

Figure 123. Port Service Management Menu

```
3 Port Service Management
>add - Add Port Services
disable - Disable Port Services
enable - Enable Port Services
list - List Port Service Information
modify - Modify Port Services
remove - Remove Port Services
```

- 31 Press **F6** (Cancel) repeatedly to return to the UNIX System V Administration menu.

Printer Administration

This section describes how to configure and administer the printer for use with the voice system.

Installing the Printer

See “Connecting the Printer,” in Chapter 4, “Connecting Peripherals and Powering Up,” in *UCS 1000 R4.2 New System Installation*, 585-313-127, for the procedure to physically connect the printer.

Configuring the Printer on the Voice System

Lucent Technologies supports the standard parallel printers that have the UnixWare 2.1.7 driver. Contact your field support personnel if you want to connect a serial printer to the system.

To configure a local parallel printer:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cviss_mainmenu**

The system displays the administration main menu ([Figure 124](#)).

Figure 124. Administration Main Menu

4 Select:

```
> UNIX System Administration
> printers
> printers
> add
```

The system displays the Add a New Printer window ([Figure 125](#)).

Figure 125. Add a New Printer Window

```
4 Add a New Printer
Printer name: _____
System name: bop13
Printer type: unknown
Similar printer to use for defaults: none
Do you want to use standard configurations? ( eg alerts, banners ): yes
Do you want to use standard port settings? ( eg baud rate, parity ): yes
Is this a Dial-up Printer? no
Device or Address: _____
```

- 5 Enter the name of the new printer in the `Printer Name:` field.
 - 6 Enter the local system name in the `System Name:` field.
 - 7 Enter **oki-320** in the `Printer Type:` field.
 - 8 Enter **none** in the `Similar printer to use for defaults:` field.
 - 9 Enter **no** in the `Do you want to use standard configurations? (eg alerts, banners):` field.
 - 10 Enter **yes** in the `Do you want to use standard port settings? (eg baud rate, parity):` field.
 - 11 Enter **no** in the `Is this a Dial-up Printer?` field.
- Note:** If you enter **yes**, the system displays a `Dial-info:` field.
- 12 Enter **/dev/lp0** in the `Device or Address:` field.
 - 13 Press **F3** (Save).

The system displays the Configure New Printer window ([Figure 126](#)).

Figure 126. Configure New Printer Window

```
5 Configure New Printer, "okidata" - Local Printer Subtask
Printer: okidata
Class: none
Description of the printer: none
File types printable without filtering: simple
Can a user skip the banner page? no
Default character pitch: Use printer defaults
Default line pitch: Use printer defaults
Default page width: Use printer defaults
Default page length: Use printer defaults
Command to run for alerts: "mail lp"
Frequency of alert (in minutes): once
Printer recovery method: beginning
Is the printer also a login terminal? no
```

- 14 Enter **none** in the `Class:` field.
- 15 Enter **printer one** in the `Description of the printer:` field.
- 16 Enter **simple** in the `File types printable without filtering:` field.
- 17 Enter **yes** in the `Can a user skip the banner page?` field.

- 18 Enter **Use printer defaults** in the following fields:
 - ~ Default char. pitch:
 - ~ Default line pitch:
 - ~ Default page width:
 - ~ Default page length:
- 19 Enter **mail lp** in the Command to run for alerts: field.
- 20 Enter **once** in the Frequency of alert (in minutes): field.
- 21 Enter **beginning** in the Printer recovery method: field.
- 22 Enter **no** in the Is Printer also a login terminal: field.
- 23 Press **F3** (Save).

The system displays the Printer: Successfully Added window ([Figure 127](#)).

Figure 127. Printer: Successfully Added Window

```
6 Printer tmp: Successfully Added.

Press CONT to Continue.

Information on tmp:
printer tmp disabled since Fri Nov 22 10:13:23 EST
1996. available.
  new printer
  Form mounted:
  Content types: simple
  Printer types: oki-320
```

24 Press F8 (Cont).

The system displays the Setup Printer Access window ([Figure 128](#)).

Figure 128. Setup Printer Access Window

```
7 Setup Printer Access

- 25 Enter **all** in the Users who are allowed access to this printer: field.
- Note:** Do not press **ENTER** until all of the fields are complete.
- 26 Enter **none** in the Users who are denied access to this printer: field.
- 27 Enter **all** in the Forms allowed on this printer: field.
- 28 Enter **none** in the Forms denied on this printer: field.
- 29 Press **F3** (Save).

The system displays the Configure Printers for the Printer Service window ([Figure 129](#)).

Figure 129. Configure Printers for the Printer Service Window

```
3 Configure Printers for the Printer Service
+add - Add a New Printer
list - List Printer Configurations
modify - Modify a Printer Configuration
remove - Remove Printers
```

30 Press **F6** (Cancel).

The system displays the Line Printer Services Configuration and Operations window ([Figure 130](#)).

Figure 130. Line Printer Services Configuration and Operations Window

```
2 Line Printer Services Configuration and Operation
classes - Manage Classes of Related Printers
filters - Manage Filters for Special Processing
forms - Manage Pre-Printed Forms
+operations - Perform Daily Printer Service Operations
printers - Configure Printers for the Printer Service
priorities - Assign Print Queue Priorities to Users
requests - Manage Active Print Requests
status - Display Status of Printer Service
systems - Configure Connections to Remote Systems
```

Note: Wait at least 10 minutes before continuing with [step 31](#).

31 Select:

```
> operation
> accept
```

The system displays the Allow Classes/Printers to Accept Requests window ([Figure 131](#)).

Figure 131. Allow Classes/Printers to Accept Requests Window

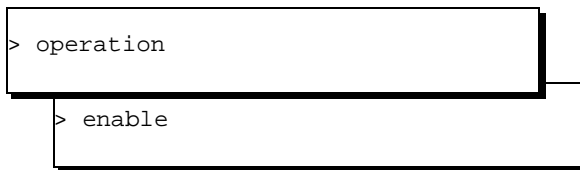

```
4 Allow Class(es) and/or Printer(s) to Accept Print Requests
Printer(s) and/or Class(es): _____
```

- 32 Enter the name of the printer in the `Printer(s) and/or Class(es):` field, or press **F2** (Choices) to select from a menu. If you select from the Choices menu, you must press **F2** (Mark) to mark each class or printer you want to accept print requests, then press **F3** (Enter).
- 33 Press **F3** (Save).
- 34 Press **F6** (Cancel) twice.

The system displays the Line Printer Services Configuration and Operations window ([Figure 130 on page 286](#)).

- 35 Select:

```
> operation
> enable
```

The system displays the Enable Printer(s) for Printing window ([Figure 132](#)).

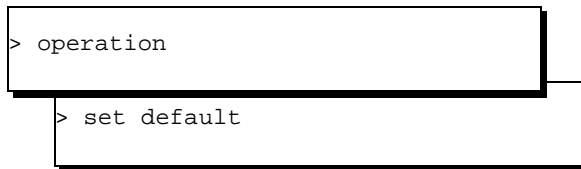

Figure 132. Enable Printer for Printing Window

- 36** Enter the name of the printer in the `Printer(s):` field, or press **F2** (Choices) to select from a menu. If you select from the Choices menu, you must press **F2** (Mark) to mark each printer you want to enable, and then press **F3** (Enter).
- 37** Press **F3** (Save).
- 38** Press **F6** (Cancel).

The system displays the Line Printer Services Configuration and Operations window ([Figure 130 on page 286](#)).

- 39** Select:

```
> operation
> set default
```

The system displays the Set Default Print Destination window ([Figure 133](#)).

Figure 133. Set Default Print Destination Window

- 40** Enter the name of the printer in the `Default Printer or Printer Class:` field, or press **F2** (Choices) to select from a menu.
- 41** Press **F3** (Save).

The system saves the printer configuration information.

Administering the Printer on the Voice System

To administer the voice system to recognize the printer:

- 1** At the `Console Login:` prompt, enter **root**
The system prompts you for a password.
- 2** Enter your root password.
The system displays the system prompt #.
- 3** Enter **cv_{is}_menu**
- 4** Select one of the following sequences:

```
> UNIX Management
```

```
> Printer Administration
```

```
> Install Okidata 320 Printer Software
```

OR

```
> UNIX Management
```

```
> Printer Administration
```

```
> Install Okidata Laser Printer Software
```

The system installs the printer software.

- 5 Press **F6** (Cancel) to finish and return to the Printer Administration menu.

Setting Up the Printer

To set up a parallel printer for use with the system:

- 1 Log on to the system as root.
- 2 Enter **cd /etc/uucp**
- 3 Edit the Systems file to add an entry for the printer. This entry must include the hex representation for the printer IP address and port.

hp4si Any hplaser - \x002<hex value for port><hex value for IP address>

For example, **hp4si Any hplaser - \x0002238cc776928** uses 238c as the hex representation for port 9100 and c7769828 as the hex representation for IP address 199.118.152.40.

- 4 Edit the Devices file with the following line:

hp4si tcp - - TLI \D

- 5 Save and exit the Devices file.

- 6 Enter **lpsystem -tbsd -Tnever -R0 -y"printer_name IP_address" hp4si**

where *printer_name* and *IP_address* are appropriate for the printer you are adding.

- 7 Enter **lpadmin -php4si -Uhp4si -lpcl -Thplaserjet**

8 Do one of the following:

- ~ If you want a banner page to print, skip the following steps a through c and continue with step 9.
- ~ If you do not want a banner page to print, complete the following steps a through c.
 - a Enter `/usr/lib/lp/model`
 - b Enter `cp standard LANHP`
 - c Edit the **LANHP** file and change `nobanner="no"` to `nobanner="yes"`.

9 Enter `lpstat -t`

The output should indicate the lpstat spooler is running and the printer you added should be displayed.

10 To make this printer the default, enter `lpadmin -dhp4si`

Remote Terminal Administration

This section describes the procedures to configure and administer a remote terminal for use with the voice system.

Configuring the Remote Terminal

Use the following procedure to configure a terminal (monitor):

- 1 Start at the UNIX System V Administration menu ([Figure 17 on page 24](#)) and select:

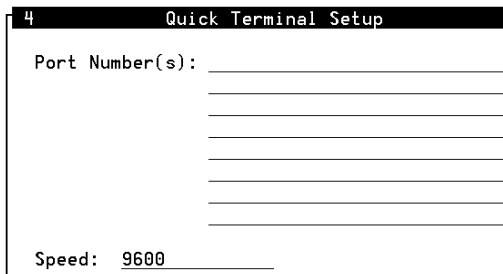

```
> ports
```

```
> quick_terminal
```

```
> add
```

The system displays the Quick Terminal Setup window ([Figure 134](#)).

Figure 134. Quick Terminal Setup Window

4 Quick Terminal Setup

Port Number(s): _____

Speed: 9600 _____

- 2 If you know the name of the port monitor, enter the name in the `Port Number(s):` field, or press **F2** (Choices) to select from a menu.
- 3 Enter the speed in the `Speed:` field, or press **F2** (Choices) to select from a menu. The default is **19200**.
- 4 Press **F3** (Save).

The system adds the terminal to the selected port monitor names and displays a confirmation window.

- 5 Press **F3** (Cont).

The system displays the Quick Terminal Setup menu.

Administering the Remote Terminal

To administer the voice system to recognize the modem:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cviss_menu**

- 4 Select:

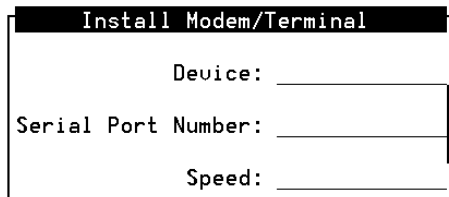

```
> UNIX Management
```

```
> Modem/Terminal Administration
```

```
> Install Modem/Terminal Software
```

The system displays the Install Modem/Terminal window ([Figure 135](#)).

Figure 135. Install Modem/Terminal Window

The screenshot shows a window titled "Install Modem/Terminal". Inside the window, there are three input fields:

- Device: _____
- Serial Port Number: _____
- Speed: _____

- 5 Enter **terminal** in the `Device:` field.
- 6 Enter a serial port number or press **F2** (Choices) to display a list of valid port numbers for the `Serial Port Number:` field.
- 7 Enter **19200** in the `Speed:` field.
- 8 Press **F3** (Save).

The system displays a confirmation window.

- 9 Press **F6** (Cancel) to finish and return to the Modem/Terminal Installation menu.

7 Common Administration

Overview

The procedures in this chapter are organized together to facilitate quick reference for some of the more common, or daily, administrative tasks. Common administration includes running system reports, and performing procedures such as system monitoring, media formatting, backups, and administering the date and time.

Command Menu

The Command Menu enables you to quickly access the System Monitor and Trace services, and exit the voice system. The Command Menu key appears as **F7** on almost every administration menu or window.

Accessing the Command Menu

To access the Command Menu:

- 1 Once you have accessed the Voice System Administration menus (as described in [Chapter 3, Voice System Administration](#)), from almost any menu or window, press **F7** (Cmd-Menu).

The system displays the Command Menu ([Figure 136](#)).

Figure 136. Command Menu

System Monitor

System administrators frequently use System Monitor first when troubleshooting a voice channel problem because the System Monitor window displays several important pieces of data in one location.

Accessing the System Monitor

To access the System Monitor window from the Command Menu:

- 1 Start at the Command Menu ([Figure 136 on page 298](#)) and select:

```
> System Monitor
```

The system displays System Monitor-Voice Channels window ([Figure 137](#)).

Figure 137. System Monitor-Voice Channels Window

System Monitor - Voice Channels					
Channel	Calls Today	Voice Service	Service Status	Caller Input	Dialed Digits
0	0		*0n Hook		
1	0		*0n Hook		
2	0		*0n Hook		
3	0		*0n Hook		
4	0		*0n Hook		
5	0		*0n Hook		
6	0		*0n Hook		
7	0		*0n Hook		
8	0		*0n Hook		
9	0		*0n Hook		
10	0		*0n Hook		
11	0		*0n Hook		

[Table 20](#) describes the columns in the System Monitor-Voice Channels window.

Table 20. Columns in the System Monitor Window

Column	Description
Channel	Lists the existing channels on the voice system. Virtual channels have the letter <code>v</code> appended to the channel number. These channels are not voice channels but are instead used for “data-only” applications. The number of virtual channels in the system depends on the software applications installed. In most systems, there is a single virtual channel for the playing of background speech.
Calls Today	Lists the number of calls made to a particular channel within the system. This column reflects the number of calls received during the day for the particular channel since the last stop and start of the voice system. When the end of the day occurs or the voice system is stopped and then restarted, the number of calls in the <code>Calls Today</code> column starts at zero. Calls are monitored for a 24-hour period, on any day beginning at midnight (12 a.m.). For virtual channels, this value is the number of times the service was used to run a data-only service.
Voice Service	Provides the name of the service that is associated with the corresponding voice or virtual channel.

1 of 2

Table 20. Columns in the System Monitor Window

Column	Description
Service Status	Indicates the state of each channel in the voice system. All hardware states (for example, On Hook, Foos, Manoos, Broken) are marked with an asterisk (*). This field is blank for virtual channels except when a transaction with a DIP is running. See Table 21 for a description of the status entries.
Caller Input	Indicates the last set of digits entered by the caller. For example, when a caller enters an account number in response to a transaction prompt, a series of touchtone digits is registered in the voice system from the caller. This information is collected by the voice system and displayed in this column by the System Monitor. This field always is blank for virtual channels.
Dialed Digits	Indicates the last set of digits dialed by the voice system during this transfer process. In many cases, the application transfers the caller to an attendant. The numbers used in this transfer process are collected by the voice system and displayed in this column. This field always is blank for virtual channels.

2 of 2

Service Status Column

[Table 21](#) describes the possible entries in the `Service Status` column and their meanings.

Note: All hardware states are marked with an asterisk (*).

Table 21. Entries for the Service Status Column

Service Status Entry	Description
*BROKEN	The channel is broken.
CCA	The channel is in process of call classification.
Coding	The channel is performing voice coding.
Collect	The channel is waiting for caller input.
dbdip1	The channel is used by a local database DIP.
*DIAGNOSE	The channel is on a circuit card that is being diagnosed.
Dialing	The channel is dialing digits.
*D-BROKEN	(PRI feature only) The D-channel is broken.
*D-HWOOS	(PRI feature only) The D-channel hardware is out-of-service.
*D-INSERV	(PRI feature only) The D-channel is in service.

1 of 3

Table 21. Entries for the Service Status Column

Service Status Entry	Description
*D-MANOOS	(PRI feature only) The D-channel is manually out-of-service.
D-NETOOS	(PRI feature only) The D-channel network is out-of-service.
D-NONEX	(PRI feature only) The D-channel is nonexistent.
DIP <0 34>	The channel is processing a request from a data interface process.
*FOOS	The channel is facility out of service.
Host	The channel is currently accessing a host.
*HWOOS	(PRI feature only) The channel hardware is out of service.
*INITING	The channel is on a circuit card that is being initialized.
*MANOOS	The channel is manually out of service.

2 of 3

Table 21. Entries for the Service Status Column

Service Status Entry	Description
*NETOOS	(PRI feature only) The channel is in a network that is out of service.
Offhook	The channel is in service and has answered a call.
*ON HOOK	The channel is in service and is waiting for a call.
Pending	The channel is going into or leaving an operational state.
Talking	The channel is playing speech.
Transfer	The channel is transferring a call,
*UNKNOWN	The channel is experiencing a breakdown in communications or an internal voice system error has occurred.

3 of 3

Changing the System Monitor Refresh Rate

By default, the system updates the voice channel status every 5 seconds.

To change the refresh rate to a specified amount of time:

- 1 Start at the System Monitor-Voice Channels window ([Figure 137 on page 299](#)) and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 2 Press **F1** (Chg-Rate).

The system displays the Change Refresh Rate window ([Figure 138](#)).

Figure 138. Change Refresh Rate Window

- 3 Enter the refresh rate in seconds in the `Refresh Rate:` field. Valid values are 1 to 30. The shorter the refresh rate, the more system resources are used to update the window.

Note: Changing the refresh rate for the System Monitor window also changes the refresh rate for the Host Session Monitor window and vice versa.

- 4 Press **F3** (Save).

The system closes the Change Refresh Rate window and saves the new rate. The new refresh rate is automatically activated in the system.

Printing the System Monitor-Voice Channel Report

To print a System Monitor-Voice Channel report:

- 1 Start at the System Monitor-Voice Channels window ([Figure 137 on page 299](#)) and press **F8** (Chg-Keys).

The system displays the alternate set of function keys.

- 2 Press **F6** (Print).

The system prints the System Monitor-Voice Channel Report.

Trace Service

A *trace* is a record of the events that occur on a voice channel, the voice system, or a host system.

See [trace on page 602](#) in [Appendix A. Summary of Commands](#), for more information on the **trace** command-line format.

Performing a Trace

To trace a channel or session or both:

- 1 Start at the Command Menu ([Figure 136 on page 298](#)) and select:

```
> Trace Service
```

The system displays the Trace Service window ([Figure 139](#)).

Figure 139. Trace Service Window

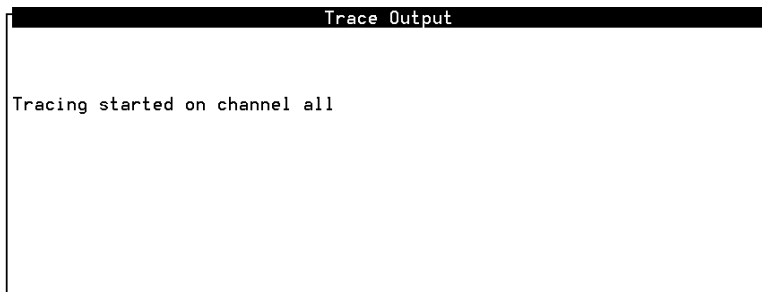

```
Trace Service
Channel or Session: all
```

- 2 Enter a single channel or session number, or **all** in the Channel or Session: field.
- 3 Press **F3** (Save).

The system displays the Trace Output window ([Figure 140](#)).

Figure 140. Trace Output Window

```
Trace Output

Tracing started on channel all
```

- 4 Select one of the following options while in the Trace Output window:
 - ~ Press **F1** (Pause) to stop the information from scrolling.
 - ~ Press **F2** (Prev Page) and **F3** (Next Page) to move around within the display.
 - ~ Press **F1** (Resume) to continue scrolling through the trace output.
 - ~ Press **DELETE** to stop the trace.
 - ~ Press **F2** (Print) from the Trace Service window to print the last 250 lines of output.

Note: Space in the **root** partition may become full from the trace service, so you should occasionally remove old files from the **/vs/trans/hostdata** directory.

Reports Administration

The Reports Administration window gives you access to some system reports, including call classification reports, call data detail reports, call data summary reports, message log, and traffic reports. The voice system allows you to tailor each report to meet your needs and requirements.

Accessing the Reports Administration Menu

To access the Reports Administration menu:

- 1 At the `Console Login:` prompt, enter **root**

The system prompts you for a password.

- 2 Enter your root password.

The system displays the system prompt #.

- 3 Enter **cvis_menu**

The system displays the Voice System Administration menu ([Figure 42 on page 59](#)).

- 4 Select:

```
> Reports
```

The system displays the Reports menu ([Figure 141](#)).

Figure 141. Reports Menu

Use the procedures in this section to access and run the various reports in this menu.

Call Classification Report

The Call Classification Report provides the following information for each extension or number dialed:

- The total number of calls
- The total number of failed calls
- The number of blind or intelligent transfer attempts that:
 - ~ Were answered
 - ~ Were busy

- ~ Rang with no answer
- ~ Experienced network problems
- Summary statistics

Displaying the Call Classification Report

To display the Call Classification Report:

- 1 Start at the Reports menu ([Figure 141 on page 310](#)) and select:

```
> Call Classification Report
```

The system displays the Call Classification Report window ([Figure 142](#)).

Figure 142. Call Classification Report Window

Call Classification Report									
Date: 04/13/1999									
Attempts									
Dialed Number	Total	Failed	Unclass	Class	Answer	Busy	Ring	Other	
0111220	1	0	0	1	0	0	0	1	
6111220	26	0	0	26	26	0	0	0	
Total	27	0	0	27	26	0	0	1	

[Table 22](#) defines the columns in this window.

Table 22. Column Description for the Call Classification Report

Column Name	Description
Dialed Number	Specifies the telephone number from the transfer attempt. Telephone numbers have a 16-digit maximum, however only 12 digits are displayed in the report. Longer numbers are truncated and displayed with an asterisk (*).
Total	Specifies the total transfer attempts to connect to the <code>Dialed Number</code> . This number is the sum of <code>Failed</code> , <code>Unclass</code> , and <code>Class</code> attempts.
Failed	Specifies the number of transfer attempts that failed because no dial tone or no energy was detected. This number corresponds to call dispositions equal to <code>1</code> , <code>2</code> , <code>3</code> , <code>4</code> , <code>E</code> , or <code>p</code> .
Unclass	Specifies the number of blind transfer attempts. This number corresponds to call dispositions equal to <code>X</code> .
Class	Specifies the number of intelligent transfer attempts. These are either Full CCA or Intelligent attempts. This number corresponds to call dispositions not equal to <code>1</code> , <code>2</code> , <code>3</code> , <code>4</code> , <code>E</code> , <code>p</code> , or <code>X</code> .
Answer	Specifies the number of transfer attempts that were answered. This number corresponds to call dispositions equal to <code>A</code> .
<i>1 of 2</i>	

Table 22. Column Description for the Call Classification Report

Column Name	Description
Busy	Specifies the number of transfer attempts that were busy. This number corresponds to call dispositions equal to <i>B</i> .
Ring	Specifies the number of transfer attempts that rang with no answer. This number corresponds to call dispositions equal to <i>N</i> .
Other	Specifies the number of times the network is busy and cannot complete a call (fast busy). This number corresponds to call dispositions <i>F</i> , <i>H</i> , <i>T</i> , or a recognized SIT.
Total	Specifies the sums of each column.
Percent	Specifies the percentage of the <i>Total</i> .

2 of 2

Modifying the Call Classification Report

You can specify the beginning and ending dates for the Call Classification Report.

To modify the Call Classification Report:

- 1 Start at the Call Classification Report window ([Figure 142 on page 311](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143](#)).

Figure 143. Actions Menu

2 Select:

The system displays the Modify Call Classification Report window ([Figure 144](#)).

Figure 144. Modify Call Classification Report Window

- 3 Enter the beginning and ending dates for the report in the `Start Date:` and `End Date:` fields using the format of `mm/dd/yyyy` for month, day, and year to limit the report to a certain date range. If you do not specify the year, the report uses the current year.

A start date of 04/01/2000 and an end date of 04/30/2000 means that the voice system displays call classification information on calls made in the month of April 2000. You can specify a range of up to 365 days, including the current date. If you specify only the start date or the end date, you receive a report for that day only. The end date must be greater than or equal to the start date. Future start dates and end dates are invalid.

- 4 Press **F3** (Save).

The system displays the previous Call Classification Report window.

- 5 (Optional) Press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

- 6 (Optional) Select:

The system redisplay the Call Classification Report reflecting the new dates.

Printing the Call Classification Report

The print option provides a complete printout of the Call Classification report.

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278](#) in [Chapter 6, Peripheral Administration](#), for more information about printer administration.

To print the Call Classification Report:

- 1 Start at the Call Classification Report window ([Figure 142 on page 311](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

- 2 Select:

```
> Print
```

The system prints the Call Classification Report using the last set of options saved to the voice system.

Updating the Call Classification Report

Use the Update function to redisplay the report. The report reflects the values last saved to the voice system.

To update the Call Classification Report:

- 1 Start at the Call Classification Report window ([Figure 142 on page 311](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

- 2 Select:

The system updates the report and displays the values last saved.

Call Data Detail Report

The Call Data Detail Report keeps data on the following:

- Date, time, and duration of the call
- Service run on the call
- Channel receiving the call
- Assigned database record number

[Table 23](#) defines the columns on this window. If multiple applications are invoked during a call, the report displays a line of summary data for the call, followed by a line of data for each application in the call.

Table 23. Column Description for the Call Data Detail Report

Column Name	Description
Record	Specifies the database record number of each call made to the voice system.
Channel	Specifies the channel on which the call was made.
Start	Specifies the time and date the call began. If multiple applications were invoked during the call, the first line of the display shows the time and date the call began. Subsequent lines for the call show the time and date that each application began.
Duration	Specifies the length of the call in seconds. If multiple applications were invoked during the call, the first line of the display for the call shows the total length of all applications in the call. Subsequent lines for the call show the length of each application invoked in the call.
Service	Specifies the script that was associated with the call. If multiple applications were invoked during the call, the first line of the display for the call (the summary line) is blank. Subsequent lines for the call show the script associated with each application invoked in the call.

Modifying the Call Data Detail Report

You can tailor the Call Data Detail Report to limit the display by changing one or more of the following parameters:

- Number of most recent call records you want to include
- Date of the data to include in the report
- Service associated with the call data

To modify the Call Data Detail Report:

- 1 Start at the Call Data Detail Report window ([Figure 145 on page 318](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

- 2 Select:

```
> Modify
```

The system displays the Modify Call Data Detail Report window ([Figure 146](#)).

Figure 146. Modify Call Data Detail Window

```
Modify Call Data Detail Report

Number of Call Records: all
                        Date: all
                        Service: all
Include Call Data Fields?: NO
```

- 3 Enter a number, range of numbers, or **all** in the `Number of Call Records:` field to specify the number of most recent records to include in the report. The default is **all**.
- 4 Enter the date to which you want to limit the report information, or **all**, in the `Date:` field. Use the format of *mm/dd/yyyy* for month, day, and year. If you do not specify a year, the system uses the current year. The default is **all**, meaning that the report displays all dates.

Note: The `Number of Call Records:` field and the `Date:` field work independently of each other. That is, if you search for a specific number of records, the Call Data Detail Report displays only the most recent call records up to that limit. From that set of records, it displays those that match the specified date and service.

For example, if the system contains 10 records for yesterday and 10 records for today and you enter **6** in the `Number of Call Records:` field and enter yesterday's date in the `Date:` field, the Call Data Detail Report displays no records. This is because the last six records were created for the current day, not for yesterday's date.

However, if you enter **all** in the `Number of Call Records:` field and yesterday's date in the `Date:` field, the Call Data Detail Report displays only the records from yesterday.

- 5 Enter a service name in the `Service:` field to limit the report to a particular service, or **all**, or press **F2** (Choice) to select from the menu. The default is **all**, meaning that the report includes every service recognized by the voice system.
- 6 In the `Include Call Data Fields?:` field, to specify if call event data should be included in the report, enter **Yes** or **No**, or press **F2** (Choice) to select from a menu. The default is **No**. If call event data does exist for a particular record, the information appears immediately after the record entry on the Call Data Detail Report window ([Figure 145 on page 318](#)).
- 7 Press **F3** (Save).
The system displays the previous Call Data Detail Report window.
- 8 (Optional) Press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

9 (Optional) Select:

The system redisplay the Call Data Detail Report window with the new parameters.

Printing the Call Data Detail Report

The print option provides a complete printout of the Call Data Detail report.

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278](#) in [Chapter 6, Peripheral Administration](#), for more information about printer administration.

To print the Call Data Detail report:

- 1 Start at the Call Data Detail Report window ([Figure 145 on page 318](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

2 Select:

```
> Print
```

The system prints the Call Data Detail Report using the last set of options that was saved to the voice system.

Updating the Call Data Detail Report

Use the Update function to redisplay the report. The report reflects the values that were last saved to the voice system. See [Modifying the Call Data Detail Report on page 320](#) for how to modify this output.

To update the Call Data Detail Report:

- 1** Start at the Call Data Detail Report window ([Figure 145 on page 318](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

2 Select:

```
> Update
```

The system updates the report and displays the values last saved.

Call Data Summary Report

The Call Data Summary Report provides an hourly summary of the calls made to the voice system. This report is similar to the Call Data Detail Report, except that the Call Data Summary Report shows the calls on an *hourly* basis by service. The system maintains approximately 7 days worth of data.

Note: Call data summary information is prepared at midnight for the entire day. Therefore, call data summary information for the current day is not available until after midnight.

Displaying the Call Data Summary Report

To display the Call Data Summary Report:

- 1 Start at the Reports menu ([Figure 141 on page 310](#)) and select:

```
> Call Data Summary Report
```

The system displays the Call Data Summary Report window ([Figure 147](#)).

Figure 147. Call Data Summary Report Window

Call Data Summary Report			
Period	Service	Average Hold Time	Usage
07:00pm - 08:00pm(04/12)	agent	0:22	1
06:00pm - 07:00pm(04/12)	SUC_Prou	1:06	4
05:00pm - 06:00pm(04/12)	SUC_Prou	0:59	2
04:00pm - 05:00pm(04/12)	(NULL)	0:00	1
04:00pm - 05:00pm(04/12)	SUC_Prou	0:43	5
03:00pm - 04:00pm(04/12)	SUC_Prou	0:49	8

[Table 24](#) describes the columns on this window.

Table 24. Column Description for the Call Data Summary Report

Column Name	Description	Comment
Period	Time, in hourly increments, when calls were made to the voice system.	
Service	Script associated with a group of calls made during the specified time.	
Average Hold Time	Average duration of a call for the specified time in minutes and seconds.	
Calls	Total number of calls for the specified time.	
Event Description	Name of the call data field.	Appears only when the Include Call Data Fields?: field is set to Yes . See Modifying the Call Data Summary Report on page 328 .

Table 24. Column Description for the Call Data Summary Report

Column Name	Description	Comment
Event No	Identifying number for each call data message.	Appears only when the Include Call Data Fields?: field is set to Yes . See Modifying the Call Data Summary Report .
Count	Either the total value of all calls for this event during the period if the event is a numeric field or the total number of all calls during the period if the event is a non-numeric field.	Appears only when the Include Call Data Fields?: field is set to Yes . See Modifying the Call Data Summary Report .

2 of 2

Modifying the Call Data Summary Report

You can tailor the Call Data Summary Report to limit the display by changing one or more of the following parameters:

- Day of the week and hours to perform data collection
- Service to include
- Whether to show call data fields

To modify the Call Data Summary Report:

- 1 Start at the Call Data Detail Report window ([Figure 145 on page 318](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

2 Select:

```
> Modify
```

The system displays the Options for Call Data Summary Report window ([Figure 148](#)).

Figure 148. Options for Call Data Summary Report Window

Options for Call Data Summary Report	
Day:	_____
Hours:	_____
Service:	_____
Include Call Data Fields?	no _____

- 3 Enter the day of the week, Monday through Sunday, for which you want to obtain report information in the `Day:` field, or press **F2** (Choices) to select from a menu.
- 4 Enter the hours for which you want report information, or **all**, in the `Hours:` field. A valid range between 0 and 23 can be specified in this field, with 0 representing midnight and 23 representing 11 p.m.

If you enter a range between 9 and 16, the system displays call data for calls made between 9 a.m. and 5 p.m. The default is **all**, meaning that the system displays call data for the entire 24 hour period for the day.

- Note:** Hourly Call Data Summary Reports are not processed until midnight of each day. If you make a request for information on Tuesday, the information will not be displayed until the following day, Wednesday.
- 5 Enter a service name, or **all**, or press **F2** (Choices) to select from a menu in the `Service:` field to limit the report to a particular service. The default is **all**, meaning that the report displays call data for all services.
 - 6 Enter **Yes** or **No**, or press **F2** (Choices) to select from a menu in the `Include Call Data Fields?:` field to specify if event data should be included on the report. The default is **No**. If call event data exists for a particular record, this information appears immediately after the record entry on the Call Data Summary Report window.
 - 7 Press **F3** (Save).
The system displays the previous Call Data Summary Report window.
 - 8 (Optional) Press **F8** (Actions).
The system displays the Actions Menu ([Figure 150 on page 337](#)).
 - 9 (Optional) Select:

```
> Update
```

The system redisplay the Call Data Summary Report window with the new parameters.

Printing the Call Data Summary Report

The print option provides a complete printout of the Call Data Summary report.

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278](#) in [Chapter 6, Peripheral Administration](#), for more information about printer administration.

To print the Call Data Summary Report:

- 1 Start at the Call Data Summary Report window ([Figure 147 on page 326](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

2 Select:

```
> Print
```

The system prints the Call Data Summary Report using the last set of options saved to the voice system.

**Updating the Call
Data Summary
Report**

Use the Update function to redisplay the report. The report reflects the values last saved to the voice system. See [on page 327](#) for how to modify this report.

To update the Call Data Summary Report:

- 1** Start at the Call Data Summary Report window ([Figure 145 on page 318](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

2 Select:

```
> Update
```

The system updates the report and displays the values last saved.

Message Log Report

The Message Log Report allows you to access voice system error messages including the:

- Priority level of the error
- Date and time the error occurred
- Source of the message
- Type of circuit card associated with the message, as well as the circuit card number and channel number
- Descriptive text

Displaying the Message Log Report

To display the Message Log Report:

- 1 Start at the Reports menu ([Figure 141 on page 310](#)) and select:

```
> Message Log Report
```

[Table 25](#) defines the information in the Message Log Report.

Table 25. Entry Description for the Message Log Report

Entry	Description
Pr	<p>Priority classification of error messages. The priority is identified by one of the following codes:</p> <ul style="list-style-type: none">~ *C (critical) — the problem is interrupting service and immediate action is needed.~ ** (major) — a potentially serious problem exists that should be fixed soon.~ * (minor) — no immediate action is necessary, but the system condition should be monitored.~ – (none) — no error; informational purposes only.
Time	Date and time when error message was generated.

1 of 2

Table 25. Entry Description for the Message Log Report

Entry	Description
Source	<p data-bbox="187 194 1169 282">Originating software process; messages are divided into subgroups according to the software process that outputs the messages. The following is a sample of possible sources:</p> <ul data-bbox="187 303 1138 819" style="list-style-type: none"><li data-bbox="187 303 1138 363">• The call data handler (CDH) process accumulates generic call statistics and application messages.<li data-bbox="187 384 623 412">• The data interface process (DIP).<li data-bbox="187 433 958 461">• The maintenance (MTC) process runs temporary diagnostics.<li data-bbox="187 481 1138 541">• The transaction state machine (TSM) process controls transactions via script execution and commands.<li data-bbox="187 562 1138 622">• The voice response output process (VROP) manages speech data base and downloads speech data to VRU.<li data-bbox="187 643 880 671">• The DIO processes are the disk input/output for VROP.<li data-bbox="187 692 623 720">• The T1 interface process (TWIP).<li data-bbox="187 740 810 768">• The speech processing interface process (SPIP).<li data-bbox="187 789 663 817">• The integrity checking (iCk) process.

2 of 2

Explaining a Message in the Message Log Report

The Explain option on the Actions Menu allows you to display more information about a specific message.

To get additional information about a particular message in the Message Log Report window:

- 1 Start at the Message Log Report window ([Figure 149 on page 334](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 150](#)).

Figure 150. Message Log Report Actions Menu

- 2 Press **F3** (Explain).

The system displays the Explain Message ID window ([Figure 151](#)).

Figure 151. Explain Message ID Window

- 3 Enter the ID of the message for which you want more information in the Message ID: field.
- 4 Press **F3** (Save).

The system displays additional information about the specified message.

Modifying the Message Log Report

You can tailor the Message Log Report to limit the display by changing one or more of the following parameters:

- Message priority
- Message source
- Circuit card
- Start and stop time for the report

- Message ID
- Number of most recent messages to be displayed

By default, the Message Log Report is configured to display every message.

To limit what is displayed in the Message Log Report window:

- 1 Start at the Message Log Report window ([Figure 149 on page 334](#)) and press **F8** (Actions).

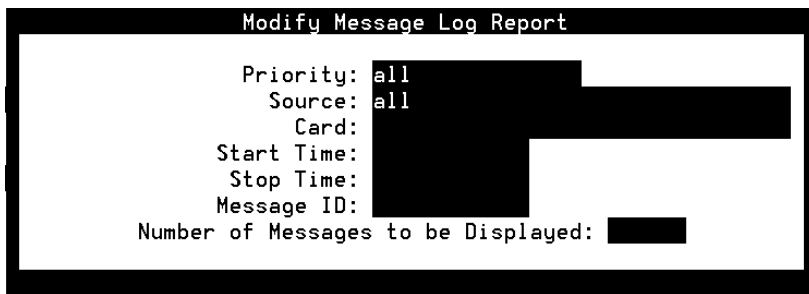

The system displays the Actions Menu ([Figure 150 on page 337](#)).

- 2 Select:

```
> Modify
```

The system displays the Modify Message Log Report window ([Figure 152](#)).

Figure 152. Modify Message Log Report Window

```
Modify Message Log Report
Priority: all
Source: all
Card:
Start Time:
Stop Time:
Message ID:
Number of Messages to be Displayed:
```

- 3 Enter *C (critical), ** (major), * (minor), **alarms**, **all**, or **events** in the `Priority:` field to limit the type of messages you want to see based on priority, or press **F2** (Choices) to select from a menu. The default is **all**.
- 4 Enter a single message source or multiple message sources separated by commas (for example, **TSM,MTC**) in the `Source:` field to limit the report to specific software processes, or press **F2** (Choices) to select from a menu. The default is **all**, meaning that all message sources are included.

- 5 Enter a single circuit card number or multiple circuit card numbers separated by commas in the `Card:` field to limit the display to specific circuit cards. There is no default value and the Choices menu is not available. If you specify **all** in the `Card:` field, the display is limited to messages about voice system circuit cards only.
- 6 Enter the start time for the message search in the `Start Time:` field, that is, the time of the first message to be displayed. For example, entering **02/05 10:00** indicates that you want to search messages that occurred on February 5 after 10 a.m.

Use the format of *MM/DD HH:MM* for month, day, hour, and minute. If the `Start Time:` field is left blank, the beginning of the message log is used. If you enter **today**, all entries since the beginning of the current day are searched.

- 7 Enter the stop time for the message search in the `Stop Time:` field, that is, the time of the last message to be displayed.

Use the format of *MM/DD HH:MM* for month, day, hour, and minute. If the `Stop Time:` field is left blank, the end of the message log is used. If you enter **today**, all messages logged up to (but not including) the current day are displayed.

Note: If nothing is entered in the `Start Time:` and `Stop Time:` fields, these fields default to 00:00 of the current date. As a result, no records are displayed in the Message Log Report.

- 8 Enter the ID of the messages to be displayed in the `Message ID:` field. Enter a single ID, multiple IDs separated by commas (for example, **TSM001,TWIP003**), or **all**.
- 9 Enter a single number from 1 to 999, or **all** in the `Number of Messages to be Displayed:` field to specify the number of most recent messages to be displayed. If you enter **all**, the report displays all messages maintained by the log. If you enter a single number, the voice system searches all records and displays only that number of the most recent records that match the specified start and stop time, priority, circuit card, and source. For example, if you enter **5**, the system displays only the **5** most recent matching records.

- 10 Press **F3** (Save).

The system displays the previously displayed Message Log report.

Use **F2** (Prev Page) and **F3** (Next Page) to scroll through the report.

- 11 (Optional) Press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

- 12 (Optional) Select:

```
> Update
```

The system updates the report and displays the values last saved.

Printing the Message Log Report

The print option provides a complete printout of the Message Log Report.

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278](#) in [Chapter 6, Peripheral Administration](#), for more information about printer administration.

To print the Message Log Report:

- 1 Start at the Message Log Report window ([Figure 149 on page 334](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

- 2 Select:

The system prints the Message Log Report using the last set of options saved to the voice system.

Updating the Message Log Report

Use the Update function to redisplay the report. The report reflects the values last saved to the voice system. See [Modifying the Message Log Report on page 338](#) for how to modify this output.

To update the Message Log Report:

- 1 Start at the Message Log Report window ([Figure 149 on page 334](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

- 2 Select:

The system updates the report and displays the values last saved.

Administrative Commands Log Report

The Administrative Commands Log report makes it possible to log the use of critical administrative commands and activities such as voice system stops and starts. The Administrative Commands Log report identifies when the command was successfully executed and whether it was done manually or by the voice system.

Commands and Activities Included in the Report

The following administrative commands and activities are monitored for inclusion in this report:

- Digital switch interface changes
- Voice equipment commands: **spfunc**, **t1prot**, **eqprot**, **hconfig**
- System control commands: **start_vs**, **stop_vs**, **disable**, **autoreboot**, **delete**, **remove**, **restore**, **hdelete**, **trace**, **erase**, **diagnose**, **vs_enable**
- Talkfile (speech files) commands: **add phrase**, **copy phrase**

Content of the Administrative Commands Log Report

The command or activity results in either one or two entries to the Administrative Commands Log:

- Start message entries — indicate the execution of the administrative command or activity
- End message entries — indicate the result of the command or activity if the information would be critical for troubleshooting purposes

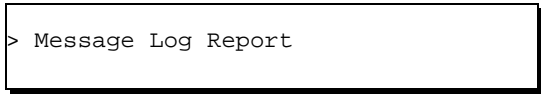

Note: Some commands and activities log only a Start message entry.

Displaying the Administrative Commands Log Report

Display the Administrative Commands Log report through the Message Log Report.

To display the Administrative Commands Log Report:

- 1 Start at the Reports menu ([Figure 141 on page 310](#)) and select:

```
> Message Log Report
```

The system displays the Message Log Report window ([Figure 149 on page 334](#)).

2 Press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

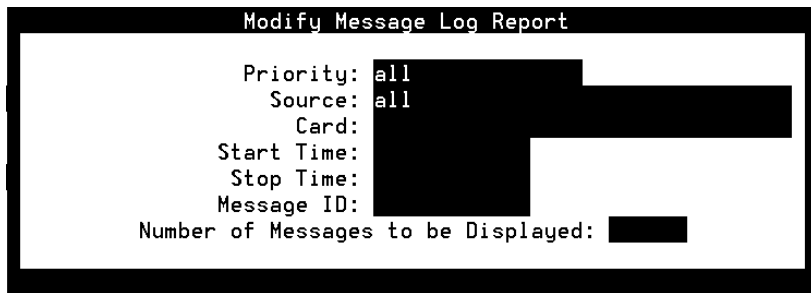

3 Select:

```
> Modify
```

The system displays the Modify Message Log Report window (Figure 153).

Figure 153. Modify Message Log Report Window

The screenshot shows a terminal window titled "Modify Message Log Report". The window contains the following text:

```
Modify Message Log Report

Priority: all
Source: all
Card:
Start Time:
Stop Time:
Message ID:
Number of Messages to be Displayed:
```

The fields for Priority, Source, Start Time, Stop Time, and Message ID are followed by black redaction boxes. The field for Card is blank. The field for Number of Messages to be Displayed is followed by a small black redaction box.

- 4 Enter **admin** in the `Priority:` field.
- 5 Enter a software process source in the `Source:` field, or enter **all** to include all software process sources.
- 6 Leave the `Card:` field blank.
- 7 Enter the start time for the message search in the `Start Time:` field, that is, enter the time of the first entry to be displayed. For example, entering **02/05 10:00** indicates that you want to search entries that occurred on February 5 after 10 a.m.

Use the format of *MM/DD HH:MM* for month, day, hour, and minute. If the `Start Time:` field is left blank, the beginning of the administrative command log is used.

- 8 Enter the stop time for the message search in the `Stop Time:` field, that is, the time of the last message to be displayed.

Use the format of *MM/DD HH:MM* for month, day, hour, and minute. If the `Stop Time:` field is left blank, the end of the administrative command log is used.

Note: If nothing is entered in the `Start Time:` and `Stop Time:` fields, the entire administrative command log is displayed.

- 9 Leave the `Message ID:` field blank.

- 10 Enter a single number from 1 to 999, or **all** in the `Number of Messages to be Displayed:` field to specify the number of most recent entries to be displayed. If you enter **all**, the report displays all entries maintained by the log. If you enter a single number, the voice system searches all records and displays only that number of the most recent entries that match the specified start and stop time, and source. For example, if you enter **5**, the system displays only the 5 most recent matching records.

- ~ Time — Date and time when the command or activity was executed
- ~ Source — Name of the originating software process that executed the command or activity
- ~ Login ID — Login ID that executed the command or activity (if applicable). A common login ID listed is **root**
- ~ Administrative command text — Full text of the command or activity executed with all applicable parameters
- ~ Disposition — Full text of the result of the command or activity

12 (Optional) Press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

13 (Optional) Select:

```
> Update
```

The system updates the report and displays the values last saved.

Printing the Administrative Commands Log Report

The print option provides a complete printout of the Administrative Commands Log Report.

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278](#) in

[Chapter 6, Peripheral Administration](#), for more information about printer administration.

To print the Administrative Commands Log Report:

- 1 Start at the Administrative Commands Log Report window ([Figure 154 on page 349](#)) displayed under the Message Log Report window and press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

- 2 Select:

The system prints the Administrative Commands Log Report using the last set of options that were saved to the voice system.

Updating the Administrative Commands Log Report

Use the Update function to redisplay the report. The report reflects the values that were last saved to the voice system. See [Modifying the Message Log Report on page 338](#) for how to modify this output.

To update the Message Log Report:

- 1 Start at the Administrative Commands Log Report window ([Figure 154 on page 349](#)) displayed under the Message Log Report window and press **F8** (Actions).

The system displays the Actions Menu ([Figure 150 on page 337](#)).

- 2 Select:

The system updates the report and displays the values last saved.

Traffic Report

The Traffic Report provides call volume information for approximately the last 7 days, including the:

- Number of calls coming in to the system during a specific time period
- Average holding time
- Percentage of time that a channel was occupied for a specific hour

Note: Traffic summary information is prepared at midnight for the entire day. Therefore, traffic summary information for the current day is not available until after midnight.

Displaying the Traffic Report

To display the Traffic Report:

- 1 Start at the Reports menu ([Figure 141 on page 310](#)) and select:

```
> Traffic Report
```

The system displays the Traffic Report window ([Figure 155](#)).

Figure 155. Traffic Report Window

Traffic Report					
TRAFFIC REPORT					
For the Period 12 am to 11 pm					
Channel	Period	Calls	Average Hold Time	% Occ	
8	07:00am - 08:00am(04/12)	1	0:23	0	
8	01:00am - 02:00am(04/12)	3	0:14	1	
16	07:00pm - 08:00pm(04/12)	1	0:22	0	

[Table 26](#) describes the information in this report.

Table 26. Entry Description for the Traffic Report

Entry	Description
Channel	Channel that handled the call
Period	Time period when system traffic is monitored
Calls	Number of calls made during the indicated time period
Average Hold Time	Average duration of a call for the specified time in minutes and seconds
%Occ	Percentage of occupancy (that is, the proportion of the hour that the channel was in use)

Modifying the Traffic Report

To change the Traffic Report, use the Modify function on the Actions Menu ([Figure 143 on page 314](#)). You can specify the date and time when you want the system to monitor call traffic, and whether you want a summary of the data.

To modify the Traffic Report:

- 1 Start at the Traffic Report menu ([Figure 155 on page 353](#)) and press **F8** (Actions).

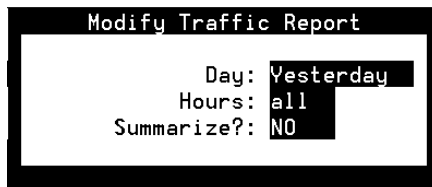

The system displays the Actions Menu ([Figure 143 on page 314](#)).

2 Select:

```
> Modify
```

The system displays the Modify Traffic Report window ([Figure 156](#)).

Figure 156. Modify Traffic Report Window

```
Modify Traffic Report
Day: Yesterday
Hours: all
Summarize?: NO
```

- 3 Enter a day of the week, Monday through Sunday, or **Yesterday** in the `Day:` field, or press **F2** (Choices) to select from a menu. The default is **Yesterday**.
- 4 Enter the hours for which you want the voice system to obtain report information in the `Hours:` field using 0 to represent midnight and 23 to represent 11 p.m. The default is **all**, meaning that the system collects traffic data for the entire 24-hour period of the day specified in the `Day:` field.

- 5 Enter **Yes** or **No** in the `Summarize?:` field to specify whether you want to see a Traffic Summary Report. The default is **No**, meaning that the system displays the Traffic Report instead of the Traffic Summary Report. The two reports are described below:
- ~ The Traffic Summary report provides information on the total traffic volume for each channel for the range of hours specified in the Traffic Report window.
 - ~ The Traffic Report provides traffic volume for each channel in 1-hour increments starting and ending with the hours specified in the Traffic Report window.
- 6 Press **F3** (Save)

The system displays the previously displayed call traffic report.

- 7 (Optional) Select:

```
> Update
```

The system updates the report and displays the values that were saved last.

Printing the Traffic Report

The print option provides a complete printout of the Traffic Report.

Note: You cannot print this report if a printer is not configured for use with the voice system. See [Printer Administration on page 278](#) in [Chapter 6, Peripheral Administration](#), for more information about printer administration.

To print the Traffic Report:

- 1 Start at the Traffic Report window ([Figure 155 on page 353](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

- 2 Select:

```
> Print
```

The system prints the Traffic Report using the last set of options that were saved to the voice system.

Updating the Traffic Report

Use the Update function to redisplay the report. The report reflects the values that were last saved to the voice system. See [Modifying the Traffic Report on page 354](#) for how to modify this output.

To update the Traffic Report:

- 1 Start at the Traffic Report window ([Figure 155 on page 353](#)) and press **F8** (Actions).

The system displays the Actions Menu ([Figure 143 on page 314](#)).

- 2 Select:

The system updates the report and displays the values last saved.

Signal Processing Activity Report

The Signal Processing Activity report is not part of the Reports Administration menu. It is generated through the use of commands.

The Signal Processing Activity report displays information about the voice system signal processing resources. These resources include:

- Signal processing algorithms
- Speech and signal processing (SSP) circuit cards
- Feature licensing

The data in the Signal Processing Activity report is collected by the **spadc** command. The **spar** command then summarizes and displays the data in an ASCII file.

Data Collection for the Signal Processing Activity Report

The **spadc** command collects data for the day of the week on which the command is executed, and outputs the data to an ASCII file named **mm-dd-yyyy** (for example, 09-12-2000).

The **mm-dd-yyyy** file contains one line of data for each 5-minute period during which the voice system is running. Each line consists of 10 fields:

- Field 1 — Date and time using the *mm/dd/yyyy:HH:MM* format.
- Field 2 — Feature licensing usage information. This field contains 10 entries representing average and peak values for the Text-to-Speech, Dial Pulse Recognition, and WholeWord Speech Recognition feature package use of the signal processing resources.
- Fields 3–8 — One field for each of the speech and signal processing circuit cards in the system. Each field contains entries representing average and peak values for circuit card occupancy, followed by average and peak values for use by each of the following processes/features:
 - ~ WholeWord Speech Recognition
 - ~ FlexWord Speech Recognition
 - ~ Echo cancellation
 - ~ Call Classification Analysis

- ~ FAX
- ~ Text-to-Speech
- ~ Dial Pulse Recognition
- ~ Play
- ~ Code
- ~ CELP

See [spadc on page 574](#) and [spar on page 575](#) in [Appendix A, Summary of Commands](#), for more information about creating a Signal Processing Activity report.

Custom Database Reports

To write a **cron** job that generates your own ORACLE database reports, include the following ORACLE environment variables in the shell application:

```
# beginning of ORACLE environment variable definition
ORACLE_SID=A;export ORACLE_SID
ORACLE_HOME=/oracle;export ORACLE_HOME
PATH=$PATH:$ORACLE_HOME/bin;export PATH
ulimit 2113674
# end of ORACLE environment variable definition
```

Common Administrative Procedures

See "Common System Procedures," in *UCS 1000 R4.2 System Reference*, 585-313-210, for information and procedures to perform the following common administrative tasks:

- Format diskettes and cartridge tapes
- Create a system backup
- Restore the system from backup
- Change the system date or time

A Summary of Commands

Overview

This appendix provides an alphabetical list and brief description of all commands. [Table 27](#) lists all the commands.

Table 27. Command Synopsis

Command	Function
add	Adds a phrase to a UNIX talkfile (SSP only).
addhdr	Adds a voice or code header to a speech file (SSP only).
alarm_cutoff	Turns off a buzzer on the TAM unit.
annotate	Annotates a TSM trace stream with a message.
assign card/channel	Assigns a group number to a card or channel.
assign_permissions	Assigns voice system security permissions to the user.
assign service/startup	Assigns an installed service to DNIS and ANI numbers or directly to a channel.

1 of 9

Table 27. Command Synopsis

Command	Function
attach	Attaches a unit.
autoreboot	Changes or displays the parameters associated with the autoreboot feature.
bbs	Reports the status of the voice system Bulletin Board.
ccarpt	Generates a call classification data summary report.
cddrpt	Generates a call data detail report.
cdsrpt	Generates a call data summary report for a specific date.
checktf	Checks for the existence of talkfiles in the voice system.
codetype	Identifies the type of coding header in a speech file (SSP only).
configure_tam	Downloads the configuration data to the TAM unit.
copy	Copies a phrase from one UNIX file to another UNIX file (SSP only).
cpuType	Returns the type of CPU used in the system.
cvis_mainmenu	Accesses the administrative menu.
cvis_menu	Accesses the Voice System Administration menu.

2 of 9

Table 27. Command Synopsis

Command	Function
dbcheck	Checks the resources available in the database.
dbfrag	Lists fragmentation information on the database.
dbfree	Checks the space available in the database by partition.
dbused	Provides database use by oracle user.
decode	Converts adpcm16 or adpcm32 files to pcm64 files (SSP only).
defservice	Defines an IRAPI service.
delete card/channel	Removes a card or channel from a service or an equipment group.
delete eqgrp	Removes an equipment group.
delete service/startup	Removes the assignment of a service to DNIS and ANI numbers or of a service assigned directly to a channel.
detach	Places a unit in the nonexistent state.
diagnose bus 1	Tests a bus while it is in service.
diagnose card	Tests a card while it is in service.
dip_int	Sends a DIP interrupt to a script on a channel or a range or channels.

Table 27. Command Synopsis

Command	Function
display assignments	Displays the services assigned to channels.
display card	Displays information about specified cards.
display channel	Displays channel information.
display dnis	Displays the services assigned to DNIS and ANI numbers.
display eqpgrp/group	Displays an equipment group report.
display messages	Displays system messages.
display_permissions	Displays voice system security permission information for the user.
display services	Lists all valid services to scripts.
display_tam	Checks the resources monitored by the TAM unit.
displaypkg	Lists the software packages installed on the voice system.
dspActAlarms	Displays the active alarms.
dspRetAlarms	Display the retired alarms.
edExplain	Edits the explanation text for one or more message tags.
encode	Converts ADPCM16 or ADPCM32 files to PCM64 files (SSP only).

Table 27. Command Synopsis

Command	Function
erase	Deletes a phrase from a UNIX talkfile (SSP only).
explain	Displays online error message explanations.
faxit	Queues or sends a fax.
faxlog	Displays a status of the fax transmissions.
findHomes	Populates a user's home directory with files saved as part of an assisted upgrade.
fixLogFile	Upgrades existing logging files.
iCk	Performs various integrity checks based on the rules in a script file.
lComp	Combines message files to produce compressed and expanded format files.
list	Lists the directory entries for specific phrases (SSP only).
logCat	Reads compressed logging files and outputs human-readable messages.
logDstPri	Creates the shared memory containing the dynamic destinations and priorities of logging messages using logMsg .

5 of 9

Table 27. Command Synopsis

Command	Function
logEvent/logMsg	Allows shell scripts to log a specific message.
logFmt	Displays and changes the parameters used to display messages and explanation texts.
mkAlerter	Reads an alerter description and generates the code that implements the description.
mkheader	Allocates user memory for script variables.
mkimage	Performs a complete system backup.
msgadm	Facilitates the administration of system messages.
newsript	Updates the changes to all currently assigned scripts.
pkgadd	Transfers the contents of a software package from the distribution medium or directory to the voice system.
pkginfo	Displays information about software packages that are installed on the system, or that reside on a particular device or directory.
pkgrm	Removes a software package from the system.
reinitLog	Used when adding custom error messages.

6 of 9

Table 27. Command Synopsis

Command	Function
remove	Places a unit in the manual-out-of-service (MANOOS) state.
removepkg	Removes a software package.
restore	Restores a unit to the in-service (INSERV) state.
retireAlarms	Turns off minor, major, and critical alarms on the TAM unit.
rmdb	Displays the state of the resource manager and modify debug levels.
show_sys	Allows you to retrieve configuration and administration information from customer sites.
soft_disc	Sends a disconnect to a script on a channel or channels.
soft_srz	Starts a script on a channel.
spadc	Collects data on the signal processing resources. Use the spar command to generate reports on the data (SSP only).
spar	Generates reports on the signal processing data activity collected by the spadc command (SSP only).
spres	Restores speech from a backup (SSP only).

7 of 9

Table 27. Command Synopsis

Command	Function
spsav	Backs up speech (SSP <i>only</i>).
spStatus	Displays information about the pack file running on an SSP card.
spVrsion	Prints the version of the SSP driver currently installed on a machine.
start_vs	Brings the voice system up to a fully operational state.
stop_vs	Stops the voice system software gracefully.
striphdr	Strips voice or code headers from a speech file (SSP <i>only</i>).
sysmon	Executes a program that monitors incoming telephone lines and the associated cards to see that they are functional.
tas	Executes the transaction assembler program to assemble script instructions.
trace	Outputs trace messages for the specified processes and channels.
trarpt	Generates the call traffic report file systems.
unassign_permissions	Removes voice system security permissions for the user.
8 of 9	

Table 27. Command Synopsis

Command	Function
upg	Provides automated assistance in upgrading the system software to the latest release.
vfyLogMsg	Verifies the information associated with a specific logging message format.
vsdisable	Disables the automatic restarting of the voice system.
vsenable	Enables the automatic starting of the voice system at system reboot.
vsusage	Displays the current load on the voice system (SSP only).
wl_copy	Copies FlexWord™ vocabularies to disk (SSP only).
wl_edit	Edits FlexWord wordlists (SSP only).
wl_gen	Creates data files for a FlexWord vocabulary.
wl_init	Generates an initial wordlist from a set of words.
wl_install	Reads FlexWord vocabularies from floppy disk (SSP only).

add

The **add** command adds a phrase to a Unix talkfile (SSP [only](#)).

Synopsis

add phrase <phrase number> to talkfile <talkfile number> from <file_name>

Description

The **add** command adds phrases to the specified talkfile that were previously extracted from another talkfile using the **copy** command. The path name for the file may be the full pathname or the relative pathname. If no path is specified, the file is created in the current working directory. If you are not in the directory in which the phrase to be added is stored, give the full path name for the talkfile and the source file. If the phrase already exists, the system displays the following message:

```
Phrase <phrase_number> already exists in talkfile
<talk file number>
Do you want to overwrite existing phrase? (y/n)
```

If an error occurs, system messages are printed on the controller screen. The source file may be a full path name or a relative path name. See Chapter 4, "Alarm and Log Messages," in *UCS 1000 R4.2 System Reference*, 585-313-210, for how to respond to a system message.

Note: The add command adds a phrase to the SPEECHDIR default directory, which is **/home2/vfs/talkfiles**. To add a phrase, the conventional naming scheme must be followed.

Files

/speech/talk/*.pl

Examples

The following example adds phrase number 275 to talkfile 25 from the phrase stored in the UNIX file phr275 in the directory **/tmp/junk**.

add phrase 275 to talkfile 25 from /tmp/junk/phr275

The following example adds phrase 104 to talkfile 18 from the phrase stored in the UNIX file phr104 in the directory **/speech/talk**.

add phrase 104 to talkfile 18 from /speech/talk/phr104

addhdr

The **addhdr** command adds a voice or code header to a speech file (SSP only).

Synopsis

addhdr [voice/pcm64/adpcm32/adpcm16/sbc24/sbc16/celp16] [tag]

Description

The **addhdr** command is a filter that adds a header to a speech file. Two mutually exclusive types of headers are supported: voice and code. A voice header identifies a file as being editable, and includes an optional identifying tag. A code header (which can be PCM64, ADPCM32, ADPCM16, SBC24, SBC16, or CELP16) identifies the way in which the file is encoded. Code headers are required on any file that is to be played on the voice system.

Before converting between voice and code headers, you must strip off any existing headers.

See Also

codetype, striphdr

alarm_cutoff

The **alarm_cutoff** command disables the buzzer on the TAM unit.

Synopsis

alarm_cutoff

There are no arguments for this command.

Description

The **alarm_cutoff** command disables the buzzer on the TAM unit.

annotate

The **annotate** command annotates the transaction state machine (TSM) trace stream with a message.

Synopsis

annotate [**channel**] <“*message*”>

Description

The **annotate** command sends a message to TSM requesting that the given message be put into TSM's trace stream. This command is useful for testing and debugging scripts.

If a channel is specified, the message is associated with the channel's trace stream. The message must be fewer than 160 characters.

The **annotate** trace message is displayed in the trace output if a trace is running when the **annotate** command is executed. If no **trace** command is running, the annotate trace message is discarded.

Files

/vs/bin/tools

Example

The following example sends a message to TSM to put the message "This is test 1 for channel 1" in channel one's trace stream.

```
annotate 1 "This is a test 1 for channel 1"
```

assign card/channel

The **assign card** command assigns a group number to a card.

The **assign channel** command assigns a group number to a channel.

Synopsis

assign card <card [.port]> to [eqpgrp] <group number> [grpname]

assign channel <number> to [eqpgrp] <group number> [grpname]

Description

The **assign card/channel** command is used when a system is installed, the number of channels or cards changes, scripts are added or deleted, telephone numbers change, or the user wants to reconfigure the system. The system uses the card and channel assignments to route an incoming call to the group.

The parameters that can be used with the **assign card/channel** command are:

- **number** — The channel number (a single card or channel number, a range of card or channel numbers specified m–n, or the word “all” for all card or channel numbers)
- **eqpgrp** — The “eqpgrp” when assigning to an equipment group
- **group number** — The number of the equipment group or service group
- **grpname** — An optional character string that can be associated with “grp”

Reference to a nonexistent channel or nonexistent group in this command causes it to fail.

Examples

The following example assigns channels 0 through 47 to equipment group 1.

```
assign chan 0-47 to eqgrp 1
```

See Also

assign service/startup

display eqgrp/group

delete eqgrp

assign_permissions

The **assign_permissions** command assigns voice system security permissions to a user.

Synopsis

```
assign_permissions <user login> <permissions level>
```

Description

The **assign_permissions** command assigns voice system security permissions to a user. Security permissions determine the areas of the voice

system that the user can access. See [Chapter 2, UNIX Administration](#), for more information on creating user logins.

The *user login* argument represents the user who is to be assigned security permissions.

The *permissions level* argument is the specific security class permission to be assigned. The security classes are as follows:

- Administration
Allows the user full voice system capabilities
- Applications
Allows the user Script Builder, configuration management, reports administration, and system monitor capabilities
- Operations
Allows configuration management, reports administration, and system monitor capabilities

Example

The following example executes the command to assign voice system security to a user with the user login of brown.

```
assign_permissions brown operations
```

See Also

unassign_permissions
display_permissions

assign service/startup

The **assign service/startup** command assigns an installed service to DNIS and ANI numbers or directly to a channel.

Synopsis

```
assign service <service_name> [startup <startup_name>] to chan  
<chan_list>
```

```
assign service <service_name> to dnis <phone_list> [ani <phone_list>]
```

```
assign service <service_name> to ani <phone_list> [dnis <phone_list>]
```

Description

The **assign service/startup** command is used to assign services to either a set of channels or to DNIS and ANI numbers. Services should be assigned after the service is verified and installed, the number of channels changes, or the system is reconfigured. Use the **display script** command to see a list of valid service names.

The *chan_list* variable indicates channel numbers or channel number ranges in the form *chan1-~~chan2~~*. A comma or space should be used to separate channel numbers in the list of channel numbers or ranges.

The *phone_list* variable indicates telephone numbers or telephone number ranges in the form *phone1:phone2*. A comma or space should be used to separate the list of telephone numbers or ranges (for example, **phone1:phone2**).

Examples

The following example assigns service stdin ("standard in" as an arbitrary name for a script) to channel 0.

assign service stdin to chan 0

The following example assigns service stdout ("standard out" as an arbitrary name for a script) to channel 1.

assign service stdout to chan 1

The following example assigns service DNIS to all channels.

assign service *DNIS_SVC to chan all

The following example assigns startup service stdout to channels 4 through 7.

assign startup stdout to chan 4-7

The following example assigns the service stdout and startup service stdin to channels 4 through 7.

assign startup stdin service stdout to chan 4-7

The following example assigns the service stdout to DNIS 5000 through 5008 and ANI any.

assign service stdout to dnis 5000:5008

The following example assigns the service stdout to DNIS 5000 through 5008 and ANI 6000.

assign service stdout to dnis 5000:5008 ani 6000

The following example assigns the service stdout to DNIS any and ANI 6000 through 9000.

assign service stdout to ani 6000:9000

The following example assigns the service stdout to DNIS 3000 and ANI 2000-3000.

assign service stdout to dnis 3000 ani 2000:3000

See Also

display eqpgrp/group

delete eqpgrp

attach

The **attach** command attaches a unit (card).

Synopsis

attach *unit number* [-i] [-n]

Description

The **attach** command is used to attach a card that has been “detached.” Use the attach command to allow the voice system to use a card that has just been replaced by hot swapping (that is, like-for-like replacement).

To put the card into service, use the **restore** command.

The parameters for the **attach** command are:

- *unit* — This option identifies the unit; the choices are “channel” or “card.”
- *number* — This option specifies the channel or card number, a range of channel or card numbers in the form m–n, or **all** for all channel or card numbers. Card numbers are in the form *card#[.port#]* where *port#* is a port of the *card#*. If *port#* is not given, all ports of the card specified are attached. If no card number or channel number is given, the system displays a syntax message.

- **-n** — This option disables prompting from the system whether to wait until a conflict has been resolved (see the **-i** option below) or to terminate the request to **attach**.
- **-i** — This option is used to enable secondary command registration. If T1 diagnostics are being run, this option allows the “attaching” of another card. If **-i** is used and another maintenance command is being run (**remove**, **detach**, **attach**, **restore**, or **diagnose**), the request to **attach** is blocked and a message is printed to the screen. If **-i** is not used and any maintenance command is being run, the request to **attach** is blocked and a message is printed to the screen.

If the command is permitted to run, it is determined if the command is in conflict with another command. A command is in conflict if the card or card associated with the command meets any of the following conditions:

- ~ T1 card is being diagnosed
- ~ An interdependency exists with the T1 card being diagnosed (for example, PRI)

If one of the above conflicts exist and **-n** is not used, the user is asked whether to wait until the conflict is resolved or to terminate the request. If T1 diagnostics are executing online tests and a conflict is detected, the **attach** command is blocked. If T1 diagnostics are executing offline tests and a conflict is detected, the user is asked whether to wait until the conflict is resolved or to terminate the request to **attach**.

Examples

The following example attaches a card 2.

```
attach card 2
```

The following example attaches port 1 of card 2.

```
attach card 2.1
```

The following example attaches a card to channel 2, port 1.

```
attach card 2.1
```

```
detach  
restore  
remove
```

autoreboot

The **autoreboot** command provides a means of changing or displaying the parameters associated with the autoreboot feature.

Synopsis

autoreboot [enable|disable] [reboots <*numbers*>] [window <*minutes*>]
[uptime <*minutes*>]

autoreboot [status|s]

autoreboot [help|h]

Description

The **autoreboot** command can be used to change parameters associated with the auto-reboot feature and to monitor the status of these parameters. The following options are recognized:

- **enable|disable** — This option specifies whether to enable or disable the autoreboot feature. The default is enable.
- **reboots <number>** — This option specifies the number of unanticipated reboots tolerated within the time period specified by *window*. The default is 5.
- **window <minutes>** — This option specifies the time period for the *reboots* parameter. The default is 60 minutes.

- **uptime <minutes>** — This option specifies the amount of time that the system must be in service before the automatic reboot feature is activated. The default is 5 minutes.
- **status** — This option shows the current values of the automatic reboot parameters, plus the number of unanticipated reboots that occurred in the *window* minutes preceding the most recent system boot.

When the auto-reboot feature is enabled and activated, the system automatically reboots after a UNIX panic. The auto-reboot feature is activated as follows:

If there were fewer *reboots* than unanticipated reboots during the *window* minutes prior to the most recent system boot, the automatic reboot feature is activated (if enabled) *uptime* minutes after the most recent system boot.

For example, assume the automatic reboot parameters are set to their default values. A system crash occurs. The system reboots at 8:00. If there were fewer than five unanticipated reboots between 7:00 and 8:00, the auto-reboot feature is activated as 8:05. Otherwise, it is activated at 9:00.

An unanticipated reboot is a system boot that occurs after a system crash. A system crash can be caused, for example, by a UNIX panic, a system restart via **RESET**, or a sudden power loss.

Example

The following example enables autoreboot feature and changes *window* to two hours:

```
autoreboot enable window 120
```

Caveat

This command must be run from ksh (KORN shell).

bbs

The **bbs** command reports status of the voice system Bulletin Board (BB).

Synopsis

```
bbs [-d] [-h] [-l]
```

Description

The **bbs** command displays the field values of the BB slots. This information is sent to standard out (stdout). Without any options, information is extracted only from the dynamic portion of the BB and printed in short format.

Otherwise the information displayed is controlled by following options:

- **-d** — Prints information about the dynamic portion of the BB (the default).

- **-h**— Prints information about the hardcoded portion of the BB.
- **-l**— Generates a long listing. The system displays all fields.

The column headings and meaning of the columns in the **bbs** listing are given in [Table 28 on page 388](#). In the table, the letter **l** indicates the **long** option, which causes the corresponding heading to appear. The **all** option means that the heading always appears.

Table 28. bbs Column Headings

Column Name	Option	Description
SLT	(all)	The slot number
BBNAME	(all)	The name associated with the process and slot
QKY	(all)	The message queue key
PID	(all)	The process ID
INS	(all)	The process instance
D	(all)	“YES” if the process is a message-sending DIP type; otherwise “NO”
CDATE	(l)	The last process creation time
WK	(l)	The ET work state

Table 28. bbs Column Headings

Column Name	Option	Description
SKEY	(l)	The semaphore key associated with the process and slot
QID	(l)	The message queue ID
RE-SPA	(l)	The number of respawns from the last restart of the voice system
WKCNT	(l)	The ET work count for process

Upon successful completion, **bbs** returns an exit status of zero. Otherwise, **bbs** prints an error message on *stderr* and returns a nonzero exit status if the voice system is not running, or if for some other reason it can not access the BB.

Example

The following example prints a long listing, displaying all possible fields.

```
bbs -l
```

ccarpt

The **ccarpt** command generates a call classification data summary report.

Synopsis

ccarpt <date>

ccarpt <start_date> <end_date>

Description

The **ccarpt** command generates a call classification data summary report. This report is stored in standard out (stdout).

The <date>, <start_date>, and <end_date> arguments may be in the form mm/dd/yy or mm/dd/yyyy.

If a 2-digit year argument is used, the following rules apply:

- If the year argument is 70 and above, the 20th century is assumed, For example, 5/27/96 is interpreted as May 27, 1996.
- If the year argument is between 00 and 69, the 21st century is assumed. For example, 5/27/06 is interpreted as May 27, 2006.

Examples

The following two examples generate the call classification data summary report for October 10, 1993, and are equivalent command statements.

```
ccarpt 10/20/93
```

```
ccarpt 10/20/1993
```

The following two examples generate the call classification data summary report from October 14 through October 20, 1993, and are equivalent command statements.

```
ccarpt 10/14/93 10/20/93
```

```
ccarpt 10/20/1993 10/20/1993
```

cddrpt

The **cddrpt** command generates a call data detail report.

Synopsis

```
cddrpt <records> <service> <calldata> <date>
```

Description

The **cddrpt** command generates the call data detail report. This report is sent to standard out (stdout). Before this can be done, the database system must be up and running, but the voice system does not need to be up.

The parameters for the **cddrpt** command are:

- **<records>** — This parameter represents the number of records to be reported. It can be any number, a range of numbers, or **all** indicating all records in the system.
- **<service>** — This parameter represents the script (application) name, or **all** for all applications.
- **<calldata>** — This parameter represents a flag indicating whether to include call event data. The valid options are **n** for not including event data or **y** for including event data.
- **<date>** — This parameter is the date the data was collected in the system. The valid options are either a date in mm/dd/yy format, mm/dd/yyyy format, or **all** indicating all records in the system.

If a 2-digit year argument is used, the following rules apply:

- ~ If the year argument is 70 and above, the 20th century is assumed. For example, 5/27/96 is interpreted as May 27, 1996.
- ~ If the year argument is between 00 and 69, the 21st century is assumed. For example, 5/27/06 is interpreted as May 27, 2006.

Examples

The following two examples generate a call data detail report for the first 100 pieces of call data collected on date October 20, 1993 for application "balance_chk" and are equivalent command statements. (Call event data, if any, is also included in the report.)

```
cddrpt 100 balance_chk y all 10/20/93
```

```
cddrpt 100 balance_chk y all 10/20/1993
```

The following example generates a call data detail report for all call data in the system without including call event data.

```
cddrpt all all n all
```

Error Messages

CANNOT FIND /vs/trans/<application>.D OR MALLOC SPACE FOR IT

If you get the above message while running **cddrpt**, take the following remedial steps:

- Make certain the **/vs/trans/<application>.D** file exists and is current.
- Remove unnecessary files from the **/vs/trans/** directory.

cdsrpt

The **cdsrpt** command generates a call data summary report for a specific date.

Synopsis

cdsrpt *<hours>* *<service>* *<event data>* *<date>*

Description

The **cdsrpt** command generates the call data summary report for a date specified. The report is stored in standard out (stdout). Before this can be done, the database system must be up and running, but the voice system does not need to be up.

The parameters for the **cdsrpt** command are:

- ***<hours>*** — This parameter is the hour the call data was collected. It can be any number between 0 to 24 or “all” indicating all 24 hours.
- ***<service>*** — This parameter is the script (application) name, or “all” indicating all applications.
- ***<event data>*** — This parameter is a flag indicating whether to include call event data or not. The valid options are “n” for not including event data or “y” to include event data.

- **<date>** — This parameter is the date the data was collected in the system in the format mm/dd/yy or mm/dd/yyyy.

If a 2-digit year argument is used, the following rules apply:

- ~ If the year argument is 70 and above, the 20th century is assumed. For example, 5/27/96 is interpreted as May 27, 1996.
- ~ If the year argument is between 00 and 69, the 21st century is assumed. For example, 5/27/06 is interpreted as May 27, 2006.

Examples

The following two examples generate a call data summary report for call data collected between 2 p.m. and 4 p.m. on date October 20, 1993 for all applications on the system, and are equivalent command statements. Call event summary is included in the report.

```
cdsrpt 14-16 all y 10/20/93
```

```
cdsrpt 14-16 all y 10/20/1993
```

The following two examples generate a call data summary report for all call data collected on date October 20, 1993 for the application “balance_chk.” Call event summary data is not included in the report.

```
cddrpt all balance_chk n 10/20/93
```

Error Messages

CANNOT FIND /vs/trans/<application>.D OR MALLOC SPACE FOR IT

If you get the above message while running **cdsrpt**, take the following remedial steps:

- Make certain the **/vs/trans/<application>.D** file exists and is current.
- Remove unnecessary files from the **/vs/trans/** directory.

codetype

The **codetype** command identifies the type of coding header in a speech file (SSP [only](#)).

Synopsis

codetype file

Description

The **codetype** command identifies the type of coding header that is present in a speech file. Codetype recognizes PCM64, ADPCM32, ADPCM16, SBC24, SBC16, or CELP16 headers.

See Also**addhdr****striphdr**

configure_tam

The **configure_tam** command is used to download the configuration file for the TAM unit.

Syntax**configure_tam**

There are no arguments for this command.

Description

The **configure_tam** command downloads the configuration file for the TAM unit. The configuration settings are saved and used as the active TAM configuration on reboot.

copy

The **copy** command copies a phrase from a UNIX talkfile to a UNIX talkfile (SSP [only](#)).

Synopsis

copy phrase *<phrase number>* from talkfile *<talkfile number>* to *<filename>*

Description

The **copy** phrase command copies a phrase from one UNIX talkfile to another UNIX talkfile. The path name for the file may be the full path name or the relative path name. If no path is specified, the file is created in the current working directory. If you are not in the directory in which the phrase to be added is stored, be sure to give the full path name for the talkfile and source file.

Note: Only the login [root](#) can copy a phrase to any of the root directories. Users without root permission can copy phrases only to directories for which they have permission, usually under their login id.

Note: The **copy** command copies a phrase from a UNIX talkfile within the SPEECHDIR default directory ([/home2/vfs/talkfiles](#)) to a UNIX file.

Examples

The following example copies phrase number 2 from talkfile 1 to the file **/speech/talk/a.1**.

copy phrase 2 from talkfile 1 to /speech/talk/a.1

The following example copies phrase number 174 from talkfile 25 to the file **/speech/talk/h.4**.

copy phrase 174 from talkfile 25 to /speech/talk/h.4

cvis_mainmenu

dbcheck

The **dbcheck** command checks the resources available in the database (Version 7 ORACLE).

Synopsis

dbcheck -i

dbcheck r

dbcheck [w n[,m]] [-s] [-e] [-m user[~user...]]

Description

The **dbcheck** command checks spaces, usage, and rollback segment growth. The **dbcheck** command has three different usages.

The *-i* option installs cron entries (optional) to run **dbcheck** at regular intervals and support for logger/alerter messages. (The *-i* option only needs to run once). The cron job can be placed in either roots cron file or added to the end of the **/vs/bin/util/croncdh** job that runs once a day. The *-i* option also asks if you want new alerter messages added to the logger/alerter database along with explanations used with the *explain* command. This installation only needs to be run if you want the warnings to show up in the system event log or if you want to schedule automatic checking at regular intervals.

The *-r* option removes any cron entry set up by the *-i* option.

The third usage actually checks database space against a user set “water marks.” Three different things are checked:

- Free space
- Extents against the user set threshold *n* (15% default)
- Rollback segment(s) growth against the user set threshold *m* (20% default)

When executed, the **dbcheck** command generates the appropriate warnings (shown under “Diagnostics” below) if the database falls below *n* percent free or if the rollback segment grows to be more than *m* percent of the total database size.

The **dbcheck** command, by default, sends warning messages to the logger/alerter indicating a threshold has been exceeded (the **-i** option must be run first). The **-e** option disables the entries from going into the log file. The **-s** option prints the warning messages to standard output. The **-m user** option allows for the messages to be mailed to *user*. Multiple users can be sent the mail by separating the user names with a tilde (~). Below are sample outputs.

(Output to error log when less than 13% available space/extents or more than 23% used by rollback)

dbcheck -w13,23

```
* Mon Feb 15 16:35:06 1993 dbcheck logTest.c:418
DBC001  -- -- -- Database 10 percent free, 3072 Blocks of 30720 available.
        Reason: Low DB Space.
* Mon Feb 15 16:35:06 1993 dbcheck logTest.c:418
DBC002  -- -- -- Extents low, 100 used of 121, on object MY_TABLE
        Reason: Low DB Extents
* Mon Feb 15 16:35:06 1883 dbcheck logTest.c:418
DBC003  -- -- -- Rollback segments=7680 blocks, 25 percent of total space.
        Reason: High Rollback Usage.
```

Files

```
LOGROOT=${LOGROOT:-"/usr/spool/log"}
${LOGROOT}/head/logDBC.h
${LOGROOT}/formats/DBCmsg
${LOGROOT}/formats/formats.mk
${EXPLAINDR}//translateLst
/vs/bin/util/croncdh
/usr/spool/cron/crontabs/root
/usr/spool/cron/crontabs/root.bu
```

Diagnostics

The **dbcheck** command returns the following values:

- 0 — Success, no limits exceeded
- 1 — Threshold exceeded
- 2 — Processing error
- 3 — Database is not running

Caveat

Once *dbcheck* log messages are installed using **dbcheck -i**, the alarm priorities, destinations, and thresholds can not be changed through the System Message Display screen as described in [Message Administration on page 67](#), of [Chapter 3, Voice System Administration](#).

explain
logCat

dbfrag

The **dbfrag** command lists fragmentation information on the database (Version 7 ORACLE).

Synopsis

dbfrag [-h -b]

Description

The **dbfrag** command is a shell script that reports on database allocation, usage, and fragmentation. The block size reported is in ORACLE blocks (2048 bytes). You can request the information to be reported in Mbytes with the **-b** option. This tool is useful to get a quick check on database usage and provides a shell interface into some key ORACLE statistics.

This tool only reports on information in the SYSTEM tablespace. With the **-h** option, the listing is printed without a header. This option is useful if you want to parse this output to select a specific field.

The following requests fragmentation information in megabytes (using the **-b** option).

dbfrag -b

SYSTEM Tablespace, Space is in Mega-Bytes

ALLOCATED	FREE	% FREE	AVG/FRAG	LARGEST	FRAGMENTS	DB_FILES	ROLLBACK
129.00	108.88	84.40	5.44	108.12	20	1	7.91

Examples

The following example gets the largest contiguous ORACLE space available.

```
dbfrag -h | awk 'length>1 {print $5}'
```

```
10240
```

Diagnostics

The program returns the following:

0 — Success

1 — Processing Error

dbcheck

dbfree

dbused

dbfree

The **dbfree** command checks the space available in the database by partition (Version 7 ORACLE).

Synopsis

dbfree [*h*]

Description

The **dbfree** command is a shell script that lists the amount of free space in the database by free contiguous blocks. The result is a detailed listing of each free memory area followed by the sum of each partition. The free blocks are listed in 2048 bytes/block (ORACLE blocks). There is also a column that lists the same information in megabytes. The **-h** option removes the column headers. Below is a sample output of the **dbfree** command.

Contiguous extents

TABLE SPACE NAME	FILE_ID	START_BLOCK	MBYTES FREE	ORACLE BLOCKS FREE
SYSTEM	1	5142	.02	12
SYSTEM	1	5560	.03	13
SYSTEM	1	4892	.04	18
SYSTEM	1	7892	.04	19
SYSTEM	1	4164	.05	28
:	:	:	:	:
:	:	:	:	:
SYSTEM	1	5598	.73	375
SYSTEM	1	8946	4.00	2048
SYSTEM	1	12650	4.45	2277
SYSTEM	1	25179	10.00	5120
SYSTEM	1	14939	20.00	10240
sum			47.18	24070

29 rows selected.

Diagnostics

The program returns the following values:

- 0 — Success
- 1 — Processing error

Caveats

The **dbfree** command creates a temporary table “dba_fragments” under user system that compresses the adjacent entries provided by the dictionary view “dba_free_space.”

dbused

dbused

The **dbused** command provides database use by oracle user (Version 7 ORACLE).

Synopsis

dbused [*hs*] [*u* <*uid/passwd*>]

Description

The **dbused** command is a shell script that shows the amount of space used by each object for a given user. Objects are tables, indexes, clusters, rollback, and cache. The default user is sti/sti. The **-s** option reports summary information grouped by objects. The special user “all” reports information for

the entire database. The **-h** option skips the header message. This option is useful if you are parsing. The **-u <uid/passwd>** option allows the user to specify the oracle user id and password (the default is sti/sti, all for all users).

Below is an output summary for user “all.”

dbused -su all

Space allocated to objects. Oracle blocks (2048 Bytes/Block)

NAME	TYPE	BLOCKS	MBYTES	EXTENTS	MAX_EXTENTS
C1	INDEX	5	.01	1	99
CCA	TABLE	5	.01	1	99

decode

The **decode** command converts adpcm16 or adpcm32 files to pcm64 files (SSP [only](#)).

Synopsis

decode [adpcm32/adpcm16]

Description

Decode is a filter that converts ADPCM16 or ADPCM32 files to PCM64 files.

Warning

Coding headers should be stripped (using the **stripdhr** command) before running **decode**.

defService

The **defService** command defines an IRAPI service.

Synopsis

```
defService [-h] [-n] [-s <servicename>] [-p <process>] [-t P | T] [-a 0 | 1 | 2 | 3 | 4] [<application>]
```

Description

The **defService** command is for use by IRAPI application developers. It creates the registration file for an IRAPI service that is necessary for assigning or deleting service to or from a channel or DNIS and/or ANI. For TSM scripts, the output of the **tas** command serves as the registration file for the script.

If the **defService** command is entered with no options, **defService** prompts you for all of the necessary information. You will need to respond to fewer prompts if you enter the majority of the information from the command line.

The **-h** option allows you to print the usage statement and then exit.

The **-n** option uses the default values for all options not specified on the command line. However, no defaults exist for the **<process>** and **<application>** parameters.

When the application is started by the Application Dispatch (AD) process, the **IRP_SERVICE_NAME** is set to the **-s <servicename>** argument if **<servicename>** is non-NULL. Otherwise, **IRP_SERVICE_NAME** is set to **<application>**, where the default is **NULL**.

The **-t** option specifies whether the process that provides the IRAPI application **<application>** is a permanent (P) or transient (T) process. The default is **P** for permanent.

If the process that provides the IRAPI application **<application>** is a permanent process, then **-p <process>** must be the name the process uses as an argument to **irRegister(3irAPI)**. If the process that provides the IRAPI application **<application>** is a transient process, then **-p <process>** must be the full pathname of the process. No default exists for this option.

When the application is executed on a PRI line, the **[-a 0 | 1 | 2 | 3 | 4]** option specifies how the ANI should be supplied to the application. The valid values for this option are as follows:

- 0 — No ANI supplied; the default
- 1 — ANI type billing number only
- 2 — ANI type billing number preferred
- 3 — ANI type calling party (SID) only
- 4 — ANI type calling party (SID) preferred

The **<application>** argument specifies the IRAPI application. No default exists for this argument.

Upon successful completion, the **defService** command creates the **/vs/trans/<application>.T** file.

tas

iRAPI -AD(4irAPI-AD)

irRegister(3irAPI)

delete card/channel

The **delete card/channel** command removes a card or channel from a service or an equipment group.

Synopsis

delete card <card.[port]> from [eqpgrp] <group number>

delete channel <number> from [eqpgrp] <group number>

Description

The **delete card/channel** command removes the specified card or channel from a service or equipment group. The parameters for the delete card/channel command are:

- **<card.[port]>** — Specifies the card or channel number (a single card or channel number from a range of 0–255, a range of card or channel numbers in the form *m–n*, or the word **all** for all card or channel numbers).
- **eqpgrp** — Specifies “svcgrp” when deleting from a service group or “eqpgrp” when deleting from an equipment group. If no group type is given, the “svcgrp” is assumed.
- **<group number>** — Identifies the equipment group or service group.

If you want to remove all cards or channels from an equipment group, it may be easier to delete the entire equipment group than to delete channels or cards. To delete an equipment group, use the **delete eqpgrp** command.

Examples

The following example deletes card 4 from service group 1.

```
delete card 4 from svcgrp 1
```

The following example deletes channels 10 through 13 from equipment group 3.

```
delete channel 10-13 from eqpgrp 3
```

See Also

```
delete eqpgrp
```

```
delete service
```

delete eqpgrp

The **delete eqpgrp** command removes an equipment group.

Synopsis

```
delete eqpgrp <group number>
```

Description

The **delete eqpgrp** removes an equipment group. The <group number> argument is the equipment group list. To remove all equipment groups, use "all" as the group number.

Examples

The following example removes equipment group number 3.

```
delete eqpgrp 3
```

The following example removes all equipment groups.

```
delete eqpgrp all
```

See Also

```
assign card/channel
```

delete service/startup

The **delete service/startup** command unassigns the assignment of a service to DNIS and ANI numbers or of a service assigned directly to a channel.

Synopsis

```
delete service <service_name> [startup <startup_name>] from chan  
<chan_list>
```

```
delete startup <startup_name> [service <service_name>] from chan  
<chan_list>
```

```
delete service <service_name> from dnis <phone_list> [ani  
<phone_list>]
```

```
delete service <service_name> from ani <phone_list> [dnis  
<phone_list>]
```

Description

The **delete service/startup** command removes the specified telephone number or channel from the group to which a script is assigned. The parameters for the **delete service/startup** command are:

- **application name** — Specifies the name of application.
- **<chan / dnis>** — Specifies the name of the service group.

- **<chan number | phone number>** — Contains a list of one or more channels or telephone numbers separated by blanks. The word “any” or “all” shows that service is removed from all calls regardless of what number was dialed.

The *chan_list* variable indicates channel numbers or channel number ranges in the form *chan1-**chan2***. Use a comma or space to separate the list of channel numbers or ranges.

The *phone_list* variable indicates telephone numbers or telephone number ranges in the form *phone1:**phone2***. Use a comma or space to separate the list of telephone numbers or ranges.

Note: Only telephone numbers that were assigned using the assign service/startup command can be deleted.

Examples

The following example deletes startup service stdout from channels 4 through 7.

```
delete startup stdout from chan 4-7
```

The following example deletes the service stdout and startup service stdin from channels 4 through 7.

```
delete startup stdin service stdout from chan 4-7
```

The following example deletes the service stdout to DNIS 5000 through 5008 and ANI any.

delete service stdout from dnis 5000:5008 and ANI any

The following example deletes the service stdout from DNIS 5000 through 5008 and ANI 6000.

delete service stdout from dnis 5000:5008 ani 6000

The following example deletes the service stdout from DNIS any and ANI 6000 through 9000.

delete service stdout from DNIS any and ani 6000:9000

The following example deletes the service stdout from DNIS 3000 and ANI 2000-3000.

delete service stdout from dnis 3000 ani 2000:3000

display dnis

detach

The **detach** command places a card or channel in the NONEX state. If a card is detached, it can then be replaced by hot swapping (that is, like-for-like replacement). The blue LED indicates that is ready to be removed from the system.

Synopsis

detach *unit number* [-i] [-n]

Description

The **detach** command places a unit currently in the manual-out-of-service (MANOOS) state into the nonexistent (NONEX) state. Before this can be done, the unit must be taken from the in-service (INSERTV) or broken (BROKEN) state and put in the MANOOS state using the **remove** command.

The parameters for the **detach** command are:

- **unit** — Identifies the unit. The choices are “channel” or “card.”
- **number** — Specifies the channel or card number, a range of channel or card numbers in the form *m–n*, or the word “all” for all of the channel or card numbers. Card numbers are in the form *card#[.port#]* where *port#* is the port of the *card#*. If *port#* is not given, all ports of the card specified are detached. If no card number or channel is given, the system displays a syntax message.

- **-n** — This optional parameter disables prompting from the system whether to wait until a conflict has been resolved (see the **-i** option below) or to terminate the request to detach.
- **-i** — This optional parameter is used to enable secondary command registration. If T1 diagnostics are being run, this option allows the “detaching” of another card. If **-i** is used and another maintenance command is being run (**remove, detach, attach, restore, diagnose**), the request to **detach** is blocked and a message is printed to the screen. If **-i** is not used and any maintenance command is being run, the request to **detach** is blocked and a message is printed to the screen.

If the command is permitted to run, a check is made to see if the command is in conflict with another. A command is in conflict if the card or card associated with it:

- ~ Is the T1 card being diagnosed
- ~ Will cause a change in the existing TDM bus master assignment
- ~ Has an interdependency with the T1 card being diagnosed (for example, PRI)

If one of the above conflicts exist and **-n** is not used, the user is asked whether to wait until the conflict is resolved or to terminate the request. If T1 diagnostics are executing online tests and a conflict is detected, the **detach** command is blocked. If T1 diagnostics are executing offline tests and a conflict is detected, the user is asked whether to wait until the conflict is resolved or to terminate the request to detach.

Examples

The following example detaches card 4 and places it in the NONEX state as far as the system is concerned.

detach card 4

The following example detaches channels 1 through 3 and places them in the NONEX state as far as the system is concerned.

detach channel 1-3

restore

diagnose bus 1

The **diagnose bus 1** command tests a bus while it is in service.

Synopsis

diagnose bus 1

Description

The **diagnose bus** command changes the temporary state of a unit to diagnostic (DIAG). If a unit fails the diagnostics, the permanent state is changed to BROKEN; otherwise, the permanent state is unchanged.

The output is sent to the screen and also saved to a file in **/vs/data/diagnose** called **busDiag.1**.

Example

The following example diagnoses bus 1.

diagnose bus 1

diagnose card

The **diagnose card** command tests a card while it is in service.

Synopsis

diagnose card *card#* [*option*]...

Description

The **diagnose card** command is done at the card level for any card in the system. The *card number* option is the card number you want to diagnose. The word “all” can be used to specify all cards.

This command changes the temporary state of a unit to diagnostic (DIAG). If a card is stuck in the INSERTV state, use the **diagnose card card# immed** command. This temporarily removes the unit from the busy state unconditionally and places it in the manual-out-of-service (MANOOS) state. Note that any calls on the card when the “immed” option is used are dropped immediately.

For T1 cards the valid options are:

- **-n** — Prevents prompting from the system during diagnostic tests. The diagnostics assume the default values during the test and the user is informed when the diagnostics are completed.

- **-i**— Enables secondary command registration. See the description of **-i** for LSPS/SSP cards below.

For LSPS/SSP cards, the valid options are:

- **-n**— Disables prompting from the system whether to wait until a conflict has been resolved (see the **-i** option) or to terminate the request to diagnose.
- **-i**— Enables secondary command registration. If T1 diagnostics are being run, this option allows another card to be diagnosed. If **-i** is used and another maintenance command is being run (**remove**, **detach**, **attach**, **restore**), the request to diagnose a non-T1 card is blocked and a message is printed to the screen. If **-i** is not used and any maintenance command is being run, the request to **diagnose card** is blocked and a message is printed to the screen.

If the command is permitted to run, a check is made to see if the command is in conflict with another. A command is in conflict if the card or card associated with it:

- ~ Is the T1 card being diagnosed
- ~ Has an interdependency with the T1 card being diagnosed (for example, PRI)

If one of the above conflicts exist and **-n** is not used, the user is asked whether to wait until the conflict is resolved or to terminate the request. If T1 diagnostics are executing online tests and a conflict is detected, the **diagnose card** command is blocked. If T1 diagnostics are executing

offline tests and a conflict is detected, the user is asked whether to wait until the conflict is resolved or to terminate the request to diagnose.

If a unit fails the diagnostics, the permanent state is changed to **BROKEN**. If the unit being diagnosed previously was marked **BROKEN** and it passes diagnostics, it is put in the **MANOOS** state. Otherwise, the permanent state is unchanged.

When diagnostics are complete, if the diagnostics passed, the T1/E1, SSP, and LSPS cards are reinitialized.

If an SSP card passes diagnostics, the system displays a message similar to the following:

```
Diagnose <card> n, Passed.
```

If a T1 card passes diagnostics, the system displays a message similar to the following:

```
All tests passed.
```

If a T1 card fails diagnostics, a help screen is provided giving you information to help resolve the reason for the failure. If you try to diagnose cards that are not installed in the system or if they are installed but are in the nonexistent state, the system displays an error message.

To delete out of the command, press **DEL**. If this does not stop the command, you may need to press **CTRL** and backslash simultaneously. Be aware, however, that this fixes the console, but does not terminate the

diagnostic routine. If, while running `diagnose`, you want to stop the command, a message similar to the following may appear:

```
Aborting request. Further administrative action may be
needed to reach desired state.
```

```
The diagnostics command for board board number has been
stopped.
```

The card will be marked as **BROKEN**.

Or, the system may display:

```
Could not stop diagnostics for board board number.
```

The diagnostics may continue to run in the background. Use the **display** command to check the state of the card.

Examples

The following example runs diagnostics on card number 3.

```
diagnose card 3
```

The following example runs diagnostics on cards 4 through 7.

```
diagnose card 4-7
```

The following example runs diagnostics on cards 4 through 7 immediately, dropping all calls currently in progress.

```
diagnose card 4-7 immed
```

dip_int

The **dip_int** command sends DIP interrupt to a script on a channel or a range of channels.

Synopsis

dip_int *channel*

dip_int *channelStart-channelEnd*

Description

The **dip_int** command sends a message or messages to TSM requesting that TSM send interrupt messages to the script running on *channel* or the range of channels *channelStart-channelEnd*. If no script is running on the channel or if TSM does not own the channel, no action is taken for the channel. The **dip_int** command does not wait for a response from TSM. Scripts running on the channel receive the EDIPIINT event.

CAUTION:

Be careful when you use this command. It may affect other applications running on the system.

Examples

The following example requests that TSM send interrupt messages to channel two.

```
dip_int 2
```

The following example requests that TSM send interrupt messages on channels one through 32.

```
dip_int 1-32
```

Return Values

If the **dip_int** is successful, a 0 value is returned. If any value other than 0 is returned, the **dip_int** command completely or partially failed.

If **dip_int** returns a value of 2, then **dip_int** failed due to temporary condition. In this case, the user should attempt the **dip_int** command again.

See Also

soft_disc

display assignments

The **display assignments** command displays the services assigned to channels.

Synopsis

disp assignments [*option*] [*option*]

Description

The **display assignments** command is used to display all the services and startup services assigned to channels. The display assignments command options are shown in [Table 29](#):

Table 29. display assignments Command Options

Option	Description
all (default)	Displays information on all services
service name	Displays channels assigned with a specific service

Table 29. display assignments Command Options

Option	Description
startup <i>startup name</i>	Displays channels assigned with a specific startup service
channel <i>chan#</i>	Displays assignments for the channel specified by <i>chan#</i> . A range of channels can be specified.

Note: If more than one option is used, the system displays only channels that satisfy all the options given. If an invalid combination of options is given, the system displays an error message.

Examples

The following example displays information for channel 1

```
disp assignments channel 1
```

The following example displays information for all channels that have the service *xxx* assigned

```
disp assignments xxx
```

The following example displays information for all channels that have the startup service *xxx* assigned

```
disp assignments startup xxx
```

display card

The **display card** command displays information about specified cards.

Synopsis

disp[lay] card [option [option]]

Description

The **display card** command displays data about a specified card or about cards in a specified state. In the output, the physical slot number, the osindex, and the voice system card number are all the same. The output also correctly reflects which card is primary master, which is secondary master, and which cards are slave.

The display card command options are:

- **card# port#** — Displays information on card *card#* and on port *port#* of the specified card. All ports are shown if *port#* is not given. A range of cards may be specified in the form *m–n* without using the *port#* option.
- **all** — Displays information on all cards.
- **t1** — Displays all T1 cards.
- **sp** — Displays all SSP cards.
- **lsps** — Displays all LSPS cards.

- **mtc** — Displays all cards being used by the maintenance process.
- **manoos** — Displays all cards in the manual out-of-service state.
- **broken** — Displays all cards in the broken state.
- **ins[erv]** — Displays all cards that have at least one channel in the in-service state.
- **netoos** — Displays all cards that have at least one channel in the network out-of-service state.
- **hwoos** — Displays all cards that have at least one channel in the hardware out-of-service state.
- **foos** — Displays all cards that have at least one channel in the facility out-of-service state.

If more than one option is used, only cards that satisfy all the options given are displayed. If an invalid combination of options is given, the system displays an error message.

Examples

The following example displays card information on channel 2 port 0.

```
disp card 2.0
```

The following example displays information on all cards.

```
disp card all
```

Sample output:

```

CARD 4 STATE: Manoos CLASS: Signal_Processor(SSP) O.S.INDEX: 4
NAME: CWB1 OPTIONS: slave,tdml
FUNCTION: play+code

```

```

CARD 6 STATE: Manoos CLASS: Digital(T1) O.S.INDEX: 6
NAME: CWB2 OPTIONS: primary_master,tdml
FUNCTION: E&M

```

The following example displays information on all cards in the "Mtc" state.

disp card mtc

The following example displays information on all T1 cards in the "Broken" state.

disp card t1 broken

display channel

The **display channel** command displays channel information.

Synopsis

disp[lay] channel *option [option]*

disp chan *option [option]*

Description

The **display channel** command is used to list information at the channel level. The **display channel** command options are:

- **number** — Displays information on the channel specified by channel number. A range of channels may be specified in the form m–n.
- **all** — Displays information on all channels.
- **mtc** — Displays all channels being used by the maintenance process.
- **telephone *tel number*** — Displays channels with telephone numbers assigned.
- **manoos** — Displays all channels in the manual out-of-service state.
- **nonex** — Displays all channels in the nonexistent state.
- **broken** — Displays all channels in the broken state.

- **t1** —This options displays all channels assigned on T1 cards.
- **sp** — This options displays all channels assigned to SSP service.
- **netoos** — This options displays all channels assigned to network service.
- **hwoos** — This options displays all channels assigned to hardware service.
- **foos** — This options displays all channels assigned to facility service.

If more than one option is used, the system displays only channels that satisfy all the options given. If an invalid combination of options is given, the system displays an error message.

Examples

The following example displays information for channel 1.

```
disp channel 1
```

The following example displays information all channels being used by the TSM process.

```
disp channel tsm
```

The following example displays information on all channels.

```
disp channel all
```

display dnis

The **display dnis** command displays the services assigned to DNIS and ANI numbers.

Synopsis

disp dnis

Description

The **display dnis** command is used to display all the services assigned to DNIS and ANI numbers.

Example

The following example displays information for all the services assigned to DNIS and ANI numbers:

disp dnis

display eqpgrp/group

The **display eqpgrp/group** command displays an equipment group report.

Synopsis

disp eqpgrp *group number*

disp group *group number*

Description

The **display eqpgrp** command is used to list all the equipment assigned to the specified equipment group. The *group number* is the number of the equipment group. If the group number is missing, the system displays a syntax message. If you specify "all", the system displays every equipment group.

Examples

The following example lists all the equipment assigned to equipment group 1.

```
disp eqpgrp 1
```

The following example lists all the equipment assigned to equipment groups 2 through 20.

```
disp group 2-20
```

The following example lists all equipment assigned to all equipment groups.

```
disp eqpgrp all
```

See Also

assign card/channel

delete eqpgrp

display equipment

The **display equipment** command displays the following output:

- serial number — displayed for E1/T1, SSP, and SBC (including CPU, IO, MEML, MEMU, and VGA cards). Not available for the LSPS.
- vintage — displayed for E1/T1 and SSP.
- suffix — displayed for E1/T1 and SSP.

display messages

The **display messages** command displays system (error) messages.

Synopsis

display messages

[priority <alarms, critical, *C, major, *,minor, **,events, all>] [-c]**

[start <mm/dd HH:MM:SS>]

[stop <mm/dd HH:MM:SS>]

[card <range,T1,TR,SP,...,all>]

[channel <range,T1,TR,SP,...,all>]

[ID <message ID1,message ID2,all>]

[source <TSM,VROP,SPIP,TRIP,...,all>]

[pattern <regular expression search pattern>]

[number,all]

Description

The **display messages** command displays error and status messages that have been logged by the voice system. Various options are provided so that the display can be limited to specific types of messages. If no arguments are supplied to **display messages**, information is displayed on how to read the messages (the message format) as well as command usage. The messages are written to standard output.

If more messages exist than can be displayed on the screen, you will be prompted with "Press the ENTER key to see more, or enter 'q' to quit." If you do not want to be prompted to press **ENTER** (that is, if you want to display all of the messages at once), use the **-c** option.

The *priority* argument should be used to display messages with specific types of urgencies. Two groups of priorities exist: alarms and events. Alarms are messages that have been reported as *C (critical), ** (major), or * (minor) priorities. Events are all the remaining messages that have no priority, for example, status messages. For example, to display the last 100 alarms, type the following:

```
display messages priority alarms 100
```

You can also display specific priorities using the *priority* option. You can specify either the name of the priority or its symbol (for example, **critical** or ***C**) To display all of the critical messages, type the following:

```
display messages priority critical all
```

Note: You should use the **priority alarm** argument when alarms are needed, otherwise use the **priority events** argument. The priority argument must be used with this command.

Combinations of priorities can also be displayed by listing each priority separated with a comma. For example, to display the last 100 alarms messages, type the following:

```
display messages priority '*C','**','*' all
```

where *C, **, and * must be enclosed in quotes.

Display Message Options

To display only specific types of messages, you may precede the number of messages to be displayed with one or more of the following options:

- ***start***
- ***stop***
- ***card***
- ***channel***
- ***id***
- ***source***
- ***pattern***
- ***number***

If more than one of the options is specified, the system displays only messages that meet all of the specifications.

start

The ***start*** option allows you to specify a starting time for display of messages. The system displays only messages that were logged on or after the time you specify. The time can be specified by date and/or a time. The word “today” is equivalent to specifying the current date. Examples of specifying the date are:

- “May 1, 1992”

- "05/01/93"
- "05-01-93"

Examples of specifying the time are:

- hh:mm:ss
- hour=hh
- min=mm
- sec=ss

where hh is 0 to 23, and mm and ss can be 0 to 59.

DO NOT mix the hh:mm:ss format with the item==xx format. If portions of the time are not specified, the time default is 0 hours, 0 minutes, and 0 seconds.

Also, giving only the time of day indicates the current date. For example, if today is January 15, 2000, the command **display messages start "12/31 09:00"** displays all of the messages that were logged starting at 9 am on December 31, 1999. In order to display messages from a previous year, you *must* specify the year. The entire start date and time must be enclosed in quotes (for example, **display messages start "April 21, 1993 13:00:00"**).

If only the date is specified, the time defaults to the beginning of the day. For example, **display messages start today** displays all of the messages that were logged today (the day in which the command is executed).

stop

The *stop* option allows you to display messages logged up to a specific time. The date and time syntax is the same as that for the *start* option. Therefore, **display messages stop today** displays all messages that were logged before today.

The *start* and *stop* options can be used together to display messages that were logged over a specific period of time. For example, **display messages start “May 1” stop “May 2”** displays all messages logged on May 1 of this year.

If you want the start and stop options to be the same day (for example, May 1), you must specify the hours and minutes for which you want to display messages. Otherwise, the time defaults to 00:00 for both the start and stop options and no messages are displayed.

card

The *card* option allows you to specify messages logged about a specific card or cards. For example, **display messages card 2** displays all messages logged that are associated with card 2. You can display combinations of cards. For example, **display messages card 2,3** displays messages for cards 2 and 3 and **display messages card 0-2** displays messages for cards 0, 1, and 2.

You can also use the *card* option to display messages logged about a specific type of card. For example, **display messages card t1** displays all messages logged about T1 cards.

channel

The *channel* option works like the *card* option. For example, **display messages channel t1** displays all messages logged about T1 channels, whereas **display messages channel 5** displays all messages logged about channel 5.

Note: The *channel* option requires an argument. Typing **display messages channel 100** attempts to display all messages pertaining to channel 100. If you want to display the last 100 messages pertaining to any channel, type **display messages channel all 100**.

Note that specifying both the *card* option and the *channel* option displays all of the specified card-related messages. However, of the channels that are specified, only those that reside on the specified cards are displayed. For example, **display messages card t1 channel all 100** displays the last 100 messages logged for T1 cards and T1 channels.

id

The *id* option allows you to display specific message ids that have been logged. For example, **display messages id TWIP004** displays all

occurrences of that message, **display messages id TWIP004,TWIP009** displays all occurrences of both messages.

source

The *source* option allows you to display messages logged by a particular system process. [Table 30](#) shows some of the standard system processes.

Table 30. Standard System Processes

Process Name	Function	Types of Messages Reported
MTC	System Maintenance Process	Card/Channel status, Diagnostic Results
SPIP	SP Card Interface Process	Speech, TTS, PRI, SR Problems/Status
TSM	Script interpreter/processor	Script Problems
TWIP	T1 Interface Process	T1 Problems/Status
VROP	Speech Database Process	Playback/Coding Database Problems

For example, **display messages source TWIP** displays all messages logged regarding T1 cards and channels.

pattern

The *pattern* option allows you to specify a regular expression as accepted by *logCat* that may appear in any part of a message. (See [logCat on page 514](#) for additional information.) The *pattern* must be enclosed in quotes and surrounded by slashes (/). For example, **display messages pattern '/XYZ'** provides all messages that use the pattern XYZ anywhere in the message.

Note: The *pattern* option is case-sensitive.

number

The *number* option specifies the number of messages you want to display, or you can use the **all** value to display all messages. The command accepts a 3-digit number so you can display up to 999 messages.

Note: Although the *number* option only allows up to 3 digits, you may have more than 999 messages logged. Therefore, you can only view up to 999 messages in the message log report with the **display messages** command. The **logCat** command with the **-t** option can be used to display all logged messages. See the **logCat** command later in this book for more information.

Display Format

All messages are displayed with two or three lines of information. Messages are separated by a blank line to ease viewing. [Table 31 on page 454](#) lists the

system message formats along with definitions and examples. Each message displayed conforms to the following format:

```
PR DAY MON DD HH:MM:SS ZZZ YYYY SOURCE
TTTTTTTT YY UU NUM TEXT...
TEXT (continuation if necessary.)
blank line
```

Table 31. System Message Formats

Field	Definition	Examples
PR	Priority	*C (Critical), ** (Major), * (Minor), ""(Event)
DAY	Day	Sun - Sat
MON DD	Date	Jan 1 - Dec 31
HH:MM:SS	Time	00:00:00 - 11:59:59
ZZZ	Time Zone	EST, EDT, CST...
YYYY	Year	1992,...
SOURCE	Source	TSM, TWIP, VROP,...
TTTTTTTT	8 char Msg ID (Tag)	TWIP2104,...
YY	FRU Type	TR, T1, SP, or HO or -- if N/A

Table 31. System Message Formats

Field	Definition	Examples
UU	Unit Type	CA (Card) or CH (Channel) or -- if N/A
NUM	Unit Number	000 to 999 or --- if N/A
TEXT	Message Text	Varies with message (see example); can be more than one line long.

Example

The following example is representative of the output that results from typing **display messages**:

```

                                MESSAGE LOG REPORT

Pr Time                Source
-- ----                -
** Wed Dec 30 15:55:16 1992TWIP
   TWIP017 T1 CA 0 Facility out of service.
               Reason: Blue alarm

* Wed Jan 6 13:38:21 1993TRIP
   TRIP002 TR CA 1 Corrupted data detected on TDM bus.
               Timeslot 254. Reason: TDM Parity Error

* Wed Jan 6 13:41:52 1993TRIP
   TRIP005 TR CH 24 No loop current.
```

display_permissions

The **display_permissions** command displays the current voice system security permissions for a particular user.

Synopsis

display_permissions <*user login*>

Description

The **display_permissions** command displays the current voice system security permissions for a particular user if any are assigned.

The <*user login*> argument represents the user for which permissions are to be displayed.

Example

The following example displays voice system security permissions for a specific user.

```
display_permissions brown
```

See Also

assign_permissions

display services

The **display services** command lists all valid services or scripts.

Synopsis

display services

disp services

Description

The **display services** command lists all valid services or scripts on a system.

Example

The following example lists all valid services or scripts currently on the system.

```
disp services
```

display_tam

The **display_tam** command displays the sensors monitored by the TAM unit, including current value, threshold values, alarm levels, actions, and so on.

Synopsis

display_tam

There are no arguments for this command.

Description

The **display_tam** command displays all the values of the sensors monitored by the TAM unit. If necessary, the **display_tam** command sends this output to page.

dspActAlarms

Synopsis

**dspActAlarms [-H] [-t *cnt*] [-b *cnt*] [-a *startTime*] [-z *endTime*]
[-s */searchPat*]**

Description

Display the active alarms.

Variables include:

- **-H** — suppress header lines prior to the first alarm.
- **-t *lines*** — tail the last "lines" of file.

- **-b lines** — show beginning "lines" of file.
- **-a locant** — specifies the place to start printing.
- **-z locant** — specifies the place to stop printing.
- **-s locant** — search for specific patterns or times. There may be more than one specification.

See Also

dspRetAlarms

retireAlarms

dspRetAlarms

Synopsis

```
dspRetAlarms [-H] [-t cnt] [-b cnt] [-a startTime] [-z endTime]  
[-s /searchPat/]
```

Description

Display the retired alarms.

Variables include:

- **-H** — suppress header lines prior to the first alarm.

- **-t lines** — tail the last "lines" of file.
- **-b lines** — show beginning "lines" of file.
- **-a locant** — specifies the place to start printing.
- **-z locant** — specifies the place to stop printing.
- **-s locant** — search for specific patterns or times. There may be more than one specification.

retireAlarms

edExplain

The **edExplain** command edits the explanation text for one or more message tags.

Synopsis

edExplain {msgID} [...]

Description

The **edExplain** command edits the explanation text for one or more message tags.

The following are environment variables for the **edExplain** command:

EDITOR

This is the program used to “edit” the explanation text. The default is vi.

EXPLAINDIR

This is the root directory of the explanation texts. The default is **/gendb/data/explain**

VERBOSITY

If set to anything, **edExplain** will run verbosely.

An explanation file is basically a clear text file. Its contents are displayed “as is” to the user when this explanation is requested. If it is a primary explanation procedure (an explanation that the end user will want to reference by name), it should begin with a line of the form:

```
<< {tag} [{tag}...] >>
```

This identifies the explanation or procedure and all its alternate names as defined in the translation file **\$EXPLAINDIR/translateLst**.

The **translateLst** file should be updated to include the msgID, msg string, and file name, in which the explain text can be found (usually just the msgID name). When exiting the **translateLst** file, enter **:w!** followed by **q**.

Two exceptions exist to the rule that the file contains clear text that will be displayed to the user:

- Any line beginning with a pound sign (#) character is considered to be an internal comment and is not displayed.
- Lines beginning with “.explain” are special directives to include at this point another explanation text in place of this line.

Example

In the following example, the first line is the SCCS identification line and is not displayed to the end user. The second line identifies the explanation. Then the text describing the problem follows.

```
# %W% %T% %H%
<< TWIP007 TWIP_BDERR >>
... text of explanation describing what a T1 card error
means...
```

encode

The **encode** command converts ADPCM16 or ADPCM32 files to PCM64 files.

Synopsis

encode [**adpcm32/adpcm16**]

Description

Encode is a filter that converts PCM64 files to ADPCM16 or ADPCM32 files.

ADPCM16 is easy to code and saves space, but does not provide good quality sound.

Warning

The voice header used by GSE should be stripped (using **stripdhr**) before running **encode**.

Appropriate code headers must be added (using **addhdr**) before the converted file can be played on the voice system.

See Also

addhdr
codetype
decode
striphdr

erase

The **erase** command deletes a phrase from a UNIX talkfile (SSP *only*).

Synopsis

erase phrase <*phrase number*> from talkfile <*talkfile number*>

Description

The **erase** command deletes the phrases identified by the phrase ID from the UNIX file. The phrase number may be any of the following:

- A single phrase, for example, **1**
- A set of phrases, for example, **1, 2, 5**
- A range of phrases, for example, **1–5**
- All phrases, for example, **all**

After you enter the **erase** command, the system displays the following message, asking you to confirm the command before each phrase is erased:

```
Do you want to erase phrase <phrase#>? (y/n)
```

If the “all” option is used for phrases, the system prompts you only *once* to confirm the command:

```
Are you sure you want to erase ALL phrases from  
talkfile <talkfile#>? (y/n)
```

If the specified phrases does not exist, the system displays:

```
Phrase <phrase#> does not exist in talkfile  
<talkfile#>  
No action taken.
```

When the system has deleted the phrase or phrases, the system prompt is displayed.

Note: The **erase** command removes a phrase from the SPEECHDIR default directory, which is **/home2/vfs/talkfiles**.

Example

The following command erases phrase 174 from talkfile 23.

```
erase phrase 174 from talkfile 23
```

The following example erases phrases 218 through 222 and phrase 225 from talkfile 26.

```
erase phrase 218-222, 225 from talkfile 26
```

The following example erases all phrases from talkfile 29.

```
erase phrase all from talkfile 29
```

copy

list

explain

The **explain** command displays on-line error message explanations.

Synopsis

```
explain {msgID} [...]
```

```
explain -l {pattern} [...]
```

```
explain -d {msgID} [...]
```

Description

The *{msgID}* is one of the two forms of identification that comes with each online error message. The primary form is **{CLASS}nnn**, where *{CLASS}* is the class of messages, such as CGEN, TSM, and *nnn* is the index of the message within the class of messages. The second form, which is available with most messages, is the mnemonic form (for example, CGEN_NOMSGQ or CGEN_MSGRCV).

If the explanation of the message fits in 24 lines and only a single explanation is requested, it is printed without interruption. If the explanation is longer than 24 lines or more than one explanation is requested, the output is *paged* via the use of a paging program. Use the **-d** option to disable paging. The default paging program is **/bin/pg**.

If the **-l** option is used, **explain** looks up all messages whose *{msgID}* matches the pattern. For example, **explain -l A V** lists the names of explanations available that begin with either "A" or "V," while **explain -l VROP** lists all explanation names available that begin with **VROP**. In other words, the *{pattern}* is anchored at the beginning of the *{msgID}* and assumes a match of anything after the pattern selected.

Variables for Advanced Users

The **explain** command is also affected by certain environment variables. These environment variables are intended for advanced users only.

PAGER

The pager program used if the explanation is longer than 24 lines or more than one explanation is requested. The default is **pg**. If you do not want paging even for long explanations, using **-d** or setting **PAGER=cat** will disable paging. A one-line form would be:

PAGER=cat explain {msgID} or explain -d {msgID}

EXPLAINDIR

The directory in which the explanation directories are found. The default is **\${PRODUCTROOT}/gendb/data/explain**.

PRODUCTROOT

This is the installation directory and defaults to **/(root)**.

VERBOSITY

This is a debugging aid. Setting it to anything causes debugging output to be generated while **explain** performs its job.

The **edExplain** command allows you to add or change explanations. An explanation comes in two parts, a file containing the explanation itself, and a set of synonyms or translations that allow the **explain** command to find the file under more than one tag. To create a new explanation, you must provide both. When modifying an existing explanation, all you need to do is edit the file containing the explanation.

The explanation file itself is almost a clear text file of what you want the user to see when they ask for the explanation. There are two features of the file that are not plain clear text. All lines beginning with the pound sign (#) character are treated as internal comments and are not output. Also lines of the form **explain {msgID}** have special meaning. They cause the inclusion of the explanation text specified by the *{msgID}*. This allows you to have common explanations and reference from more than one explanation.

The recommended format for an explanation procedure is:

Comment and SCCS keywords

```
<< {msgID} [{msgID}...] >>  
{text of message}
```

...

When creating a new explanation procedure, you will be asked to edit the synonyms list and be placed in the appropriate **translateLst** file. There are instructions at the top of the file. Each noncomment line is a list of synonyms, with the right most word on the line being the name of the file in which the text is located. For example:

```
ADM001ADM_SYSERR  
ALERT003AL_INVALID_THRESHOLDAL_INVALID_T
```

The description for ADM001 and ADM_SYSERR are found in a file named **ADM_SYSERR**. The description for ALERT003 and AL_INVALID_THRESHOLD are found in a file named **AL_INVALID_T**. The

second example has a truncated file name, because file names are limited to 14 characters in most UNIX systems and if you want to use source code control, then the file name must not be longer than 12 characters. The recommended way to store an explanation is under a file name related to the mnemonic *{msgID}* rather than the *{CLASS}nnn* name, since the later is meaningless. A file name of the form *{CLASS}nnn* does not provide a sophisticated user with much information about the contents of the file, while the mnemonic form does. If the mnemonic is longer than 12 characters, then you should create a shorter name related to the mnemonic that is unique within 12 characters.

The following environment variables affect the behavior of **edExplain**

EDITOR

This is the name of your preferred text editor. The default is vi.

EXPLAINDIR

This is the directory in which the explanation directories are found. The default is **`$(PRODUCTROOT)/gendb/data/explain`**.

PRODUCTROOT

This is the installation directory. The default is /.

VERBOSITY

This is a debugging aid. Setting it to anything cause debugging output to be generated while **edExplain** performs its job.

Files

/gendb/data/explain # directory in which explanation directories are located.

/gendb/data/explain/translateLst # file containing the synonym list of {msgID}s.

findHomes

The **findHomes** command populates your home directory with user files saved as part of an assisted upgrade.

Synopsis

findHomes [-?] [-v] [-D <dir>]

Description

The **findHomes** command provides a convenient way to restore your files from the location where they are saved by the Upgrade Assistance Package to the home directory for each user defined in the **/etc/passwd** directory.

Note that this command only works if users have the same login ID as they had on the preupgrade system.

For each user, the entire directory structure (including all files) preserved from the user home directory on the pre-upgrade machine is moved to the user home directory on the upgraded system. If a saved file has the same name as a file that already exists in a user's home directory on the upgraded system, the saved version is moved to **o.<filename>** in that directory.

Files for any users whose login IDs change from the pre-upgrade system to the upgraded system must be manually moved from their saved location to their new home directory. This manual intervention is also required for any user who did not use his login ID as the name of his home directory on the pre-upgrade system.

The **findHomes** command should be run after the assisted software upgrade is complete and logins for all users expected to move from the pre-upgrade system to the upgraded system are administered on the upgraded system.

The **[?]** argument displays a help message.

The **[-v]** argument causes a list of saved files to be printed as they are moved.

The **-D <dir>** argument specifies an additional directory to be searched for saved user files.

The Upgrade Assistance Package saves user files in **/home/o.<homedir>**, where **<homedir>** is the last directory in the full-path-name home directory specified for each user in the **/etc/passwd** file on the preupgraded system. Often, **<homedir>** is the user's login ID. If the file restoration to this directory

fails, then the files are restored in a directory with the full path name of the user's home directory on the preupgraded system.

Note: A message is printed indicating any directory for which all the files are not successfully relocated.

Example

The following example causes all files found in **/home/o.<homedir>** and **/usr/<homedir>** to be moved to the home directory specified for each non-system user specified in the **/etc/passwd** file on the upgraded system:

```
findHomes -v -D/usr
```

fixLogFile

The **fixLogFile** command upgrades existing logging files after **IComp** is run so that data continues to be readable by **logCat**.

Synopsis

```
fixLogFile [-d] [-s {save-file}] [-r] [-a] [-S] [-o {spec}] [-n {spec}]  
file1 [file2...]
```

Description

When classes of logging messages are expanded, contracted, inserted, or removed, **fixLogFile** can change the index assignments of messages. When this happens, messages whose indexes changed and were logged under the previous environment become unexpandable by **logCat**. The **fixLogFile** command, given information about the previous assignments and the new assignments, upgrades logged data so that it remains expandable by **logCat**.

Each message is examined. If the class of messages appears in the new environment and still covers the index assigned to the message, a new index is assigned based on where it appears in the new environment. If the class of messages is no longer part of the message logging environment or if a class is reduced in size so that it no longer covers the index of a message, then it is necessary to use one of the following three options:

- **-d** — Deletes the message entirely from the logging file.
- **-r** — Demaps the message. This entails expanding the message in the old environment and then creating a new logging message using the LOG_REMAP_DISCARD format. The data is still readable in the log files, but is marked as being part of a discarded message environment. This is the default behavior.
- **-s {save_file}** — Removes the message from the original logging file and saves it in the specified file, thus preserving the unique data for possible later retrieval.

Normally, **fixLogFile** generates a short message about each file that it converts. The **-S** flag suppresses this output.

The fixLogFile command requires access to the **old o.systemLog.h** and **o.textLogFmt** files and the new **systemLog.h** file to perform its job. It expects to find these files in **\$LOGROOT/formats**. If alternate sources of these files are to be used, the **-o** and **-n** flags are used. Each of these flags takes a *{spec}* argument, which has the following form:

{dir}[,{systemLog.h}][,{textLogFmt}]

The default values for these two specifications is:

-o \${LOGROOT}/formats,o.systemLog.h,o.textLogFmt
-n \${LOGROOT}/formats,systemLog.h,textLogFmt

The *{dir}* portion specifies an alternate directory in which the **[o.]systemLog.h** and **[o.]textLogFmt** files are to appear. If the remainder of the *{spec}* is missing, the default file names apply. If specified, the **{systemLog.h}** and **{textLogFmt}** portions specify the names of these two files as they appear in the specified *{dir}*. Any section of the specification that is skipped retains its previous or default value.

A list of one or more logging files may be specified. If they are listed, each one is assumed to be a compressed logging file and is converted. The **-a** option automatically converts all of the compressed logging files found in **\${LOGROOT}/data**. No file names can be provided if the **-a** option is specified. When the **-a** option is used, each regular file found in

`#{LOGROOT}/data` is examined to see if it is a compressed logging file. If it is not, it is ignored. If it is, it is converted.

After the files are converted, the time stamps are reapplied so they have the same date after conversion as they did before the conversion.

Caveats

The `fixLogFile` *command* only takes care of changes in classes of logging messages. For example, if the class PERM was added, removed, or moved, `fixLogFile` could correctly deal with the changes to the logging files. The `fixLogFile` command does not deal with reorganizations or changes of messages within a class. Do *not* change the order of appearance messages or the arguments to a logging message if you expect to be able to expand the data in the future or save the previous `textLogFmt` file for the expansions.

If the conversion takes place while the `logdaemon` process is running, be sure to either stop and restart `logdaemon` or reinitialize it using the `reinitLog` command.

iCk, iCkAdmin

The **iCk** process is the daemon process that performs various integrity checks on the system based on rules in a script file.

The **iCkAdmin** command is a related administration command.

Synopsis

```
iCk [-v NNN] [{envName}={value}] [{rule-file}]
```

```
iCk -c [-i | -f {file} | cmd...]
```

```
iCkCmd [-i | -f {file} | cmd...]
```

```
iCkAdmin [-c] [-a {on|off}] [s {entryType [:{ID}]]  
[-e {entryType [:{ID}]} [iCk.rules-file]
```

Description

The iCk process performs various jobs that fall into the category of “integrity” checks. It is driven by an ASCII file containing rules describing the checks desired to be performed. Its primary job is to run as a daemon process, started by **init**, and to perform the specified jobs at the intervals specified by the rules. Its secondary job is to serve as a command interface to a human user and convey commands to the **iCk** process which is running as a daemon process.

As a daemon process, **iCk** accepts one flag, the **-v** flag, which initializes the internal verbosity flags according to the value *NNN* provided. This value can be in decimal, hexadecimal, or octal. None of the symbolic flag names apply in this mode. [Table 32](#) describes the bit meanings.

Table 32. Verbose Flag Values

Bit	Name	Description
0x0001	V_RESCANBB	Log messages whenever the Bulletin Board is rescanned
0x0002	V_TIMINGMSG	Log messages when timing messages are sent
0x0004	V_HUNGPROCESS	Log messages when hung process checking is performed
0x0008	V_AUTOREBOOT	Log messages when autoreboot processing is performed
0x0010	V_FILEMAX	Log messages when maximum file checks are performed
0x0020	V_FILECHECK	Log messages when file ownership/modes are checked
0x0040	V_PIPECMDSD	Log messages when pipe commands are received
0x0080	V_TRACE	Log messages about all major routines in iCk
0x0100	V_SERVICE	Log messages whenever a service is queued or performed

**Environment
Variables**

The **iCk** *command* also accepts environment variables from the command line of the form:

{variable-name}={value}

These can be used to set the following environment variables that also affect the behavior of the **iCk** command:

VERBOSITY

This is an alternative way to set the internal verbosity flags. The meanings of the bits are the same as for the value supplied to the **-v** flag.

SHELL

This specifies the name of the shell to be used when executing commands. The default is **/bin/sh**.

UTMP

This specifies where the “utmp” file associated with the system is located. Currently, this value is not used except for debugging purposes.

PATH

This indicates where **iCk** finds executable programs. The default is **/bin:/etc:/usr/bin:/vs/bin:/vs/bin/util:/vs/bin/tools**.

When running as a daemon process, **iCk** accepts a file name, which is the name of the rules file from which it is supposed to operate. If not specified, the default rules file is **/vs/etc/iCk.rules**.

When **iCk** is executed with the **-c** flag or by the alternate name **iCkCmd**, is run as the command interface to the **iCk** daemon process.

- i** This option specifies that **iCk** to run in interactive mode. This causes it to generate prompts as it requests information from its standard input.
Without the **-i** flag, **iCk** silently accepts input from its standard input. This might be useful if used in a shell script.
- f {file}** This value causes **iCk** to read a series of commands from the specified file or device instead of from its standard input.
- {cmd}...** This field causes **iCk** to use the remaining arguments on the command line as the commands to be sent to the **iCk** daemon process.

See [Commands on page 490](#) for details about commands to which **iCk** will respond.

Administers Rules File

The **iCkAdmin** command administers the **iCk rules** file. It has no direct communication with the **iCk** daemon process. Changes it might make to the rules file do not take effect until the **iCk** daemon process is requested to read the modified rules file.

- **-c**

This option causes **iCkAdmin** to verbosely check out the rules file and report complaints.

- **a {on|off}**

This option causes the rules file to be read, the **autoReboot** entry set the specified state, and written back out again.

- **-s {entryType[:{ID}]}**

This option causes the rules for the specified entries to be shown.

- **-e {entryType[:{ID}]}**

This option allows interactive editing of the specified entries. *This feature is not yet complete.*

For both the **-s** and **-e** options, the **entryType** is the name of a type of entry minus the dollar sign (\$) character, that is, **rescanBB**, **timingMsg**, etc. The optional **{ID}** field means the name of the process for **timingMsg** and **hungProcess** entries and the name of the file for **fileMax** and **fileCheck** entries.

Rules File

Comments begin with the pound sign (#) character and continue to the end of the line. All blank lines are ignored. Activity requests are indicated by keywords, all of which begin with the dollar sign (\$) character.

In the descriptions of the activities, the following definitions apply:

- *{process}* — This is the ASCII name of a process appearing in the Bulletin Board, that is, TSM or MTC.

- *{runlevels}* — This is specification of the run levels at which to perform the activity. The syntax is the same as used by *init*, that is, 4 = run level 4, 234 = run levels 2, 3, or 4.
- *{checkPeriod/Time}* — This indicates the activities performed repetitively will have a specification of either how often to perform the activity or at what times of the day or week to perform the activity. One of three forms is used:

~ -

Perform the activity once when the rules are first read and then do not perform it again.

~ checkPeriod

A period of time is specified as the sum of a number of different time elements: [NNd] [NNh] [NNm] [NNs]. For example, 5m means “every 5 minutes,” and 5h 30m means “every five and a half hours.” Each element is a number followed by the type of specifier, d, days, h, hours, m, minutes, s, seconds. The order is irrelevant. 5h 30m is the same as 30m 5h.

~ Time

If it is more important that an activity be performed at a specific time of day or week, then the “time” format should be used. It has the following form: **X {monthday} {weekday} {hour} {min} {sec}**

All five elements are required for the specification to be accepted. Each element can be:

- *
All items in class (days of the month, hours in the day, and so on.).
- N
The specific item
- N-M
The items between N and M inclusive
- N,M
The individual items N and M in the class

The items within each class are:

- *{monthday}* — 1-31
- *{weekday}* — ASCII day of the week (sun, mon,...)
- *{hour}* — 0-23
- *{min}* — 0-59
- *{sec}* — 0-59

For example: “* * * 0 0” means perform each hour on the hour.
“13 fri 12 0 0” means perform the activity at noon on any Friday the 13th.

- *{cmd}* — This specific command is executed if the activity so dictates. Within the command itself, there are four meta-words that can be used to generate flexible commands. Not all four meta-words have meaning in all cases.

~ %f

The full file name

~ %d

The directory portion of the file name

~ %b

The base name of the file name

~ %p

The process identification (PID) of the process

Activities

- **\$timingMsg {process} {runlevels} {checkPeriod/Time}**

This activity causes a timing message to be sent to a specified process at regular intervals whenever the system is at one of a specified run levels. Currently, the TSM and the VROP processes expect to receive timing messages once every 2 seconds.

- **\$hungProcess {process} {runlevels} {checkdPeriod/Time} {timeout}{fill}{report}{exec cmd}}**

This activity causes a specific process, whose name appears in the Bulletin Board, to be evaluated to see if it is hung in regard to reading its messages. Processing only takes place when the system is at one of the specified run levels. *{timeout}* is the length of time the process can stay in the “working” state before being declared hung. Once a process is determined to be hung, one of three responses are possible:

~ kill

The process is killed by sending it first a **SIGUSR1** signal, followed by a **SIGKILL** signal if it does not voluntarily exit.

~ report

A message is logged to the effect that the process is hung. No other action is taken.

~ exec

The specified command is executed. The %p meta-word has the value of the PID of the process associated with the rule.

- **\$autoReboot** *{off/on}* *{u-reboots}* *{ubPeriod}* *{runlevels}* *{setPeriod}*

This activity controls the feature that automatically sets the UNIX kernel autoreboot flag. If the entry is marked “off,” then the autoreboot flag is not automatically turned on. It can still be manually set with an **iCk** command. If the entry is marked “on,” then the automatic setting is enabled. The remaining parameters control when the flag is set. The algorithm that controls the setting of the flag is as follows:

- ~ The number of unanticipated reboots of the kernel is determined by examining the **/etc/wtmp** file (the history file of **init** actions) for “change of run level” entries and “boot time” entries. Any entry falling within the *{ubPeriod}* of time prior to the most recent system boot time are considered. If a “boot time” entry is preceded by a “change of run level” to levels 0, 5, or 6, the boot is considered anticipated, since someone deliberately entered the command to reboot the system. If a “boot time” entry is not preceded by such a “change of run level” entry, then the reboot is considered unanticipated. This includes power failures, reset button pushes, and panics of the UNIX kernel.
- ~ If the number of unanticipated reboots is less than *{u-reboots}*, the autoreboot flag is set *{setPeriod}* to an amount of time after the system comes up to one of the run levels specified by *{runlevels}*.
- ~ If the number of unanticipated reboots is greater than or equal to *{u-reboots}*, setting of the autoreboot flag is inhibited and is not set until the system has been up at one of the run levels specified by *{runlevels}* for a *{ubPeriod}* of time.

For example, typing **\$autoReboot on 5 60m 4 5m**, which is the standard default setting, specifies that if fewer than five unanticipated reboots occurred in the past 60 minutes, the autoreboot flag is set in the UNIX kernel 5 minutes after reaching run level 4. If five or more unanticipated reboots occurred in the past 60 minutes, then the autoreboot flag is not set until 60 minutes after reaching run level 4.

- **\$fileMax {file} {maxSize} {checkPeriod/Time} reduce {minSize}**
\$fileMax {file} {maxSize} {checkPeriod/Time} remove
\$fileMax {file} {maxSize} {checkPeriod/Time} exec {cmd}

This activity checks one or more files to ensure that they have not grown too large. *{file}* is the name of a file or a pattern specifying a set of files. *{maxSize}* is the maximum size in bytes to which a file must grow to before it triggers a response from **iCk**. A check on the size of the file or files is made as specified by *{checkPeriod/Time}*. One of three responses to a file becoming too large can occur:

~ reduce

The offending file is reduced in size by saving the last *{minSize}* bytes of the file and discarding the rest.

~ remove

The offending file is removed entirely.

~ exec

The command specified is executed. In this case the meta-words **%f**, **%d**, and **%b** are defined as the various parts of the file name and can be used in the command.

- **\$fileCheck** *{file}* *{runlevels}* *{checkPeriod/Time}* *{type}* *{owner}* *{groups}* *{modemask}* *{modes}* [*cmd*]

This activity can be used to ensure that a specific file or files exist and have the proper ownership and modes. *{file}* specifies the file or a pattern that selects a set of patterns. *{runlevels}* specify at which run levels the checks are made. *{checkPeriod/Time}* specifies the frequency of checks. *{type}* specifies the type of file. It can take one of seven values:

- ~ - The type does not matter.
- ~ *f* The file is a “regular” file.
- ~ *d* The file is a directory.
- ~ *p* The file is a named pipe.
- ~ *c* The file is a character special device.
- ~ *b* The file is a block special device.
- ~ *l* On SVR5.4 systems, the file is a symbolic link.

The {owner} variable specifies who owns the file. If this value is -, then who owns the files is not of interest. *{group}* specifies which group owns the file. If this value is -, then which group owns the files is not of interest. *{modeMask}* specifies which bits of the mode are of interest while *{modes}* is the state of the bits desired. For example, if both *{modeMask}*

and *{modes}* were 0444, then the check would be to ensure that the file is readable by anyone, but whether it is writable or executable is not of interest. If on the other hand *{modeMask}* was 0777, while *{modes}* was 0444, then the check would be to ensure that the file is only readable and must not be writable or executable by anyone. If a file fails to pass a `$fileCheck` test, it is always reported. If the optional *[cmd]* is specified, then this command is executed. The meta-words %f, %d, and %b are set to the various parts of the file name for use in the command.

- **\$EOF**

This special mark indicates the end of the rules. Anything beyond this mark in the rules file is ignored.

Examples of Rules

\$fileMax /etc/wtmp 360000 ~* * * 0 0~ reduce 36000

If the file `/etc/wtmp` exceeds 360,000 bytes, reduce it to 36,000 bytes. Check the size of the file on the hour. (The structures in this file are 36 bytes in length and it must be an integral number of structures, hence the chosen sizes.)

\$fileCheck /etc/passwd - - f root - 0777 0444

Check only once. The `/etc/passwd` file should be owned by `root` and be read-only to everyone.

\$fileCheck /etc/shadow - - f root - 0777 0400

Check only once. The **/etc/shadow** file should be owned by *root* and be read-only to *root*.

\$fileMax /tmp/*.lst 10000 - remove

Remove all the files in **/tmp** ending with an extension of *.lst* if they are bigger than 10,000 bytes. Do this only once.

\$fileMax /tmp/*.hist 0 - exex ~/bin/mv %f %d/o.%b~

For any nonzero-length files in **/tmp** with an extension of *.hist*, save them as **/tmp/o.*.hist**

Commands

In command mode, **iCk** responds to the following commands. Each command sends a message to the **iCk** daemon process except for the first command. All commands can be abbreviated to the shortest unique string. Hence **au** is sufficient to identify the *autoReboot* function and **ac** the **activate** function. For most commands one letter is sufficient.

- **x** “ | “ **exit** “ | “ **^D**

This command exits from the interactive command mode. This does not affect the **iCk** daemon process.

- **bootCnts** [**period**]

This command computes the UNIX reboot information from the **/etc/wtmp** file. If *period* is supplied, this length of time is used. If it is not supplied,

then the window period of time for the **\$autoReboot** rule is used. This command generates three numbers: the total number of reboots in the specified period of time *prior to* and including the current boot of the system, the number that were anticipated (or deliberate), and the number of unanticipated reboots. This request does not communicate with the **iCk** daemon process.

- **autoReboot {set|clear}**

This command forces the kernel autoreboot flag into the specified state.

- **readRules [rule-file]**

This command rereads the rules file. If a new file name is provided, then it is read instead of the previous file. Before using this command, the new rules should be checked with the **iCkAdmin** command to insure syntactic correctness.

- **wakeup**

This command makes the **iCk** daemon wake up immediately and check its state.

- **rescanBB**

This command makes the **iCk** daemon wake up and reexamine the Bulletin Board for new instances of known process types.

- **quit**

This command causes the **iCk** daemon to exit gracefully. (Since **iCk** is normally run from the **/etc/inittab** file, **init** immediately respawns the daemon.) In interactive mode, the command requires confirmation.

- **verbosity {value}**

This command sets the **iCk** daemon's verbosity flags to the specified values. In this case, the symbolic names are accepted as well as octal, decimal, or hexadecimal values. Combined values can be produced by separating values with the pipe (|) character.

- **activate {spec}**

This object, in conjunction with the V_TRACE flag, causes the activities specified by *{spec}* to be logged whenever they execute.

- **inhibit {spec}**

This object, in conjunction with the V_TRACE flag, causes the activities specified by *{spec}* not to be logged whenever they execute.

- **print {spec}**

This object logs the status of the activities specified by *{spec}*. The status information logged as a result of the **print** command varies based on the activity. The common information printed is the activity index, which may be used in future *{spec}*'s, the rule index, which should correspond to the position of the rule in the rules file, and the type of the activity. In addition,

there is the *a_clockID*, which is nonzero if an alarm is running for the current activity and the **a_nextAlarm**, which indicates at what time the next alarm is set to expire. At the end of the entry is the **a_flags**, 0, meaning no flags are set, **AF_SUPPRESS_TIMING**, meaning that timing is deliberately suppressed for the time being, **AF_CHECK_NEW_RUNLEVEL**, meaning that when the run levels change, this activity is checked to see if it should reactivate, and **AF_DEBUG_OFF**, which is set for any activity that has been inhibited by the **inhibit** command. There is also the **a_state**, which indicates the current state of the activity. Its values are:

- ~ **AS_INACTIVE** — This value is currently not being processed.
- ~ **AS_TIMER_RUNNING** — There is currently an alarm outstanding for this activity.
- ~ **AS_SERVICE_QUEUED** — An alarm has expired for this activity, but has not yet been processed.
- ~ **AS_IN_PROGRESS** — An activity is currently being processed.

The above-mentioned commands, **activate**, **inhibit**, and **print**, require an activities specification. Such a specification is defined from the following list of objects. More than one object can be combined with the pipe (|) character:

- **rescanBB**

This object is the **\$rescanBB** activity.

- **timingMsg**
This object is all the **\$timingMsg** activities.
- **hungProcess**
This object is all the **\$hungProcess** activities.
- **autoReboot**
This object is the **\$autoReboot** activity.
- **fileMax**
This object is all the **\$fileMax** activities.
- **fileCheck**
This object is all the **\$fileCheck** activities.
- **miscellaneous**
This object applies to the **print** command only. It causes a report of whether the autoreboot flag was automatically set or not, the state of the UNIX kernel autoreboot flag, the current run level, the number of rules read, and the number activities currently in force to be logged.
- **all/ALL**
This object specifies all activities.
- **NNN**
This object, where *NNN* are digits, specifies an explicit activity by its index in the array of all activities.

All remaining information is activity specific. By activity the information logged is:

- **\$timingMsg**

The name of the process, the Bulletin Board slot, and instance.

- **\$hungProcess**

The name of the process, the PID, the Bulletin Board state, work count, time, flag, slot, and instance. The flag can have values of HP_STUCK, meaning that it does not seem to be reading its message queue, HP_SIGUSR1, meaning it has been sent a SIGUSR1 signal to request it to die, and HP_SIGKILL, meaning that it has been killed with the uncatchable SIGKILL signal.

- **\$autoReboot**

The computed unanticipated reboot count at the time the system was last rebooted plus the length of the period over which the computation is made.

- **\$fileMax**

The name of the file.

- **\$fileCheck**

The name of the file.

- **core**

This command is available for debugging purposes. It causes **iCk** to produce a core file in **/tmp/iCk.core** via a core dump operation in a spawned child process. In other words, **iCk** itself does not stop, but you do get a reliable core of **iCk** for debugging evaluation.

Default File

The **iCk** process responds to default parameters placed in **/vs/etc/default/iCk**. Initially there are two values. These values set specific internal parameters:

- **RUNLEVELTIMEOUT**

This parameter specifies how long to wait after changing run levels before accepting the value from **/etc/utmp** without confirmation from **iCkCmd**. The default is 3 minutes.

- **RECHECKTIMEOUT**

This parameter specifies how long to wait after changing run levels before rechecking for new processes in the Bulletin Board. The default is 30 seconds.

Also any environment variables desired can be set in the default file.

Files

/vs/etc/iCk.rules # the default rules file

/tmp/iCkPipe # the named pipe used to speak to iCk

/vs/etc/default/iCk # default parameters

Caveats

The **iCk** process is a daemon process running as “root.” Since the rules support the concept of executing an arbitrary command, the **/vs** and the **/vs/etc** directories need to be protected against tampering and the **iCk.rules** file should only be writable by authorized users.

logCat

logCat

Syntax

```

[-{t|b} lines] [-c] [-m]           # Simple behaviors
[-a locant] [-z locant]           # Beginning and endings
[-s locant] [-q locant] [-R]     # Selection of messages
[-P priority]
[-d data -l log-prefix |         # Source of data
-L {cmpMsg} | file] [-r root]
[-f format] [-V]                 # Display options
[-w width] [-p continuation-prefix]
[-T textLogFmt] [-A {s|c}:abbreviations]
[-B breakChrs] [-[U|H]]
[-v] [-D]                        # Misc/debug options

```

Default behavior with no arguments is to display all the files of the 'L' type specified first in the Config file, that is:

```
logCat -d${LOGROOT}/data -l{primary-log-prefix}
```

Variables

- **-t lines** — Tail the last "lines" of file
- **-b lines** — Show beginning "lines" of file
- **-v** — Verbose; report information on files examined

- **-c** — Continuously display last lines of file
- **-m** — Meticulous time check. Normally the log file name and the creation date are used to determine the date of the file. To be sure that the creation dates are accurate, use the **-m** flag. This causes the time stamp of the first message in each log file to be used instead of the name and modification date. This is slower, but more reliable.
- **-r root** — Specify alternate "root" directory for **textLogFmt** file. The default is **\usr\spool\log**.
- **-a locant** — Specifies the place to start printing.
- **-z locant** — Specifies the place to stop printing.
- **-s locant** — Search for specific patterns or times. There may be more than one **-s** specification.
- **-q locant** — Search for specific pattern in raw unexpanded log data. This is much faster than **-s** for pattern searches, but only the variable portion of the log messages can be included in the search pattern. There may be more than one **-q** specification.
- **locant** — One of two things: either a date/time stamp OR a search pattern. See [Locants on page 502](#) for an extended description.
- **-w width** — If lines are to be wrapped, this is the width at which the wrapping should take place. 0 means no wrapping and is the default. The width can also be supplied via the environment variable LOGCOLUMN.

- **-p continuation-prefix** — The string to be appended to each continuation line. The default is no continuation prefix. The continuation prefix can also be provided via the environment variable LOGCONTPREFIX.
- **-d data** — Name of the directory to find the log files in. The data directory can be provided in the environment variable LOGDATA. The default is \${LOGROOT}/data.
- **-l log-prefix** — Prefix of the log files to examine. The default is the first log file in the Config file. The log-prefix can also be provided by the environment variable LOGFILEPREFIX.
- **-L cmpmsg** — If just one compressed message needs to be interpreted, the **-L** option can be used to pass a single compressed message to "logCat" as an argument for interpretation.
- **file** — explicit file to be displayed. If "-", use standard input.
- **-f format** — Format specification for printing messages. See [Format on page 506](#) for details.
- **-V** — Make control characters visible. They are printed as \X if they have a special C notation, otherwise as <NNN>, where NNN is the octal value.
- **-R** — Specifies that search patterns in locants are being specified in the "regular" expression language, rather than the "sh" meta-language. See the details above.

- **-P** — Selects messages by their priority. Priorities can be specified as a number or as the symbolic representations - for E_NONE, M for E_MANUAL, * for E_MINOR, ** for E_MAJOR, and *C for E_CRITICAL. More than one -P can be specified if more than one priority is of interest. For example:

-P 3 -P 4 # All E_MAJOR and E_CRITICAL msgs.

-P * -P *C # All E_MINOR and E_CRITICAL msgs.

- **-T textLogFmt** — Specifies an alternate "textLogFmt" file to be used when expanding logging messages. This feature must be used carefully. The alternate "textLogFmt" file must be compatible with the "cmpLogFmt" used to log the messages in terms of the number and order of fields for each message.
- **-A {s|c}:abbreviations** — Enable abbreviation translations using a script found in the file abbreviations.
- **-A o** — Disable abbreviation translations. See the description of abbreviations below under ABBREVIATIONS.
- **-B breakChrs** — The list of characters to be used as word separators. The default list is all white space and punctuation characters. If any abbreviations begin with these characters, then a modified list of break characters must be provided which excludes characters used to start abbreviations.

- **-U** — Unhide "hidden" messages. This option causes all messages, including those being hidden by the "hideMsg" command to be displayed.
- **-H** — Enable the "hide" message feature. This option is used to toggle off the **-U** switch when it appears earlier on the command line or in the **\$HOME/.logCatRC** file.
- **-D** — Set a debug flag, which causes locants to be printed at the beginning and some statistics to be listed at the end of the run.

logCat can take its options from **\$HOME/.logCatRC**. This allows the user to tailor his or her "logCat" behavior without having to enter it on the command line each time "logCat" is used. Options in the **.logCatRC** file should be the same as they appear on the command line. The options that make most sense to put in the **.logCatRC** file are **-m, -r, -p, -f, -V, -R, -T, -A, -B, -U,** and **-D**.

Locants

Locants can be either date/time specifications or search patterns.

Dates can be any of the standard human readable forms: mmm dd, yyyy, mm/dd/yy, mm-dd-yy, etc. The time is hh:mm:ss. It is also possible to specify the separate elements as follows: sec=nn, min=nn, hour=nn, mday=mm, mon=nn or mon=mmm, year=nn[nn], wday=n or wday=ddd, yday=nnn.

Dates and times are interpreted with some degree of intelligence and flexibility. A date without a time is assumed to mean "midnight" of the

specified date, in other words, "Oct. 11, 97" and "10/11/97" are assumed to be "10/11/97 00:00:00". A month and a day without a year are assumed to be in the current year unless this would put it more than 1 month in the future, when it is assumed to be the previous year. For example, assuming that it is currently "Mar. 3, 98", if the user specifies "02/15", it is assumed to be "02/15/98". If the user specifies "11/3", it is assumed to be "11/03/97", since "11/03/98" would put it more than 1 month in the future, which is unlikely to be what the user had intended. You can force the proper interpretation of any date by fully specifying it; that is, adding the day of the month and the year.

If the form "item=xxx" form is used, all elements not specified default to '*', hence "wday=Sun" means all messages on any Sunday. *Do NOT* mix standard format with the "item=xxx" format. The results are unpredictable.

Spaces should be enclosed in quotes, for example, -a"7/14/87 05:08:30". Search patterns are enclosed in forward slash (/) characters, with an optional repetition count following, for example, -z/GEN006/2 means the second message containing "GEN006".

The repetition count has no meaning with the "-s" or "-q" locant, but does for the "-a" and "-z" locants.

Locants can have their meaning reversed by preceding them with an exclamation point (!), for example "-s!/{pattern}/" means everything that *does not* match the pattern. Normally "-s" and "-q" locants logically OR together if there is more than one. It is possible to AND them together by adding a plus

sigh (+) sign immediately following the s or q for the second and subsequent locant that is to be OR'ed together. For example:

```
"-s/GEN006/" "-s+!/New York/"
```

means on messages containing "GEN006", but not containing "New York".

It is also possible to apply search locants to specific fields of a message by specifying a "synthetic field" and an equal sign prior to the search pattern. For example, "-s@sym@=!/LG_BADARGS/" means all messages that are not of type "LG_BADARGS."

The search capability supports two different languages. The default language is compatible with the standard "sh" syntax and supports the following meta-search constructs:

- **^** — Beginning of message
- **\$** — End of message
- ***** — Any number of unspecified characters
- **?** — A single unspecified character
- **[xxx]** — Any character in the list "xxx"
- **[!xxx]** — Any character NOT in the list "xxx"
- **\<chr>** — Normal C backslash conventions, \n \t \b \f \r \NNN \\ \

The second search language uses the standard "regular" expression syntax. It is in effect when the -R flag is specified. It supports:

- **^** — Beginning of message
- **\$** — End of message
- **.** — A single unspecified character
- **[xxx]** — Any character in the list "xxx". "xxx" may include ranges of characters: A-Z, etc.
- **[^xxx]** — Any character not in the list "xxx"
- **<chr>*** — Any number of occurrences of <chr> including 0
- **<chr>+** — Any number of occurrences of <chr> with a minimum of 1
- **<chr>{m,n}** — From 'm' to 'n' occurrences of <chr>
- **\<chr>** — Normal C backslash conventions, \n \t \b \f \r \NNN \\ \[
- **(pat)** — Parentheses serve to group portions of a pattern. {pat} can be any legal pattern of its own. The '*', '+', and '{m,n}' operators can be applied to the entire grouping within the (), (in other words, ([bB]ob)+ means one or more occurrences of "bob" or "Bob").

Format

The basic format of the message can be controlled in a number of ways. The "-f" option or the LOGFORMAT environment variable specify the format using the following special sequences to specify the various parts of a message. The default format is: "%P %T %N %S:%L\n%M"

- **%P(...)** — Priority level format: %d or %s
- **%T(...)** — Time level format: all options supported by "date" cmd. There is also an additional format, "%u", which is the Unix time printed as an 8-digit hexadecimal number.
- **%N** — Name of process.
- **%S** — Sourcefile name.
- **%L** — Line number.

Message text

If (%r) is specified, the fields of the message are not expanded, but just entered "raw." If a separator character is specified, it is placed between each raw field. If it is not specified, then the *FS* character is placed between each field and a *GS* character is placed after the last field, which is just the way the fields would appear in the compressed logging files.

- **%C** — The entire compressed message.
- **%%** — % character.

- `\{chr}` — Standard C backslash conventions
- ... — All other characters are printed as is.
- Synthetic Fields — Synthetic fields are alternate names for `%P`, `%T`, `%N`, `%S`, `%L`, and `%M` fields, but they also give access to specific fields within the `%M` field by name or index. The legal synthetic fields are:
 - ~ `@index@` OR `@id@` OR `@i@` — The absolute index of the message.
 - ~ `@symbol@` OR `@sym@` OR `@s@` — The symbolic name of the message.
 - ~ `@class@` OR `@c@` — The class of the message.
 - ~ `@classIndex@` OR `@ci@` — The index of the message within its class.
 - ~ `@priority@` OR `@pri@` OR `@p@` — The priority of the message in `%s` format.
 - ~ `@time@` OR `@t@` — Equivalent to `%T`. These may be followed by specifiers like `".sec"`, `".hour"`, `".mon"`, and so on, to get a specific part of the time.
 - ~ `@program@` OR `@prog@` — Equivalent to `%N`.
 - ~ `@file@` — Equivalent to `%F`.
 - ~ `@line@` — Equivalent to `%L`.
 - ~ `@field@[xxx]` OR `@f@[xxx]` — Where `xxx` is either a numerical index of the field or the symbolic name of the field.
 - ~ `@message@` OR `@msg@` OR `@m@` — The fully expanded message.
 - ~ `@cmpmsg@` — The original compressed message.

Abbreviations

It is possible to translate common abbreviations. The **-A** option controls this behavior. Abbreviations and acronyms can be translated using a translation script. The feature is turned on with the **-A c/s abbreviations** option. It can be forced off, if enabled via the environment variable, via the **-A a** option.

The file **abbreviations** is the source of the translations. Translations is done in one of two forms, "simple", denoted by s, or "complex", denoted by c. In simple translation mode, each abbreviation found in a message is translated directly to the specified alternate form in the *abbreviations* file. In complex mode, each abbreviation found is translated into "translation (abbreviation)". For example, if the translation was:

```
btw = "by the way"
```

and the message was:

```
btw, an error occurred
```

in "simple" translation mode, the message would be printed as:

```
by the way, an error occurred
```

while in "complex" translation mode, the message would be printed as:

```
by the way (btw), an error occurred
```

All translations are done by WholeWord. If the WholeWord does not match the acronym, then no translation takes place.

An abbreviations file is a file containing two word couplets. Any line beginning with a pound sign character (#) is ignored and all blank lines are

ignored. If either the abbreviation or the translation includes white spaces, it must be enclosed in quote characters as was shown in the example above.

The abbreviations feature can also be enabled by setting the environment variable LOGABBREVIATIONS=*M:file*, where *M* is either s or c, and *file* is the name of the file.

IComp

The **IComp** command combines a series of message files and produces a file of compressed format files and an expansion format file.

Synopsis

```
IComp [-s name] [-c name] [-t name] [-d name] [-m name]  
<file1> [file2...]
```

Description

IComp compiles logging format files. The input files are in the form:

```
XXX...NNN... message.....%fff[<<SQL spec>>]...  
%fff[<<SQL spec>>]...%fff[<<SQL spec>>]...
```

In other words, the input files contain standard C format statements, with optional SQL field definitions included. Long lines may be broken up with backslash, newline sequences. Such lines are concatenated, discarding the

backslash and newline characters, by **IComp** and treated as one long line during compilation.

IComp produces five files: a header file, a compressed format file, an expansion format file, a data dictionary file, and a data dictionary mapping file. The default names are **systemLog.h**, **cmpLogFmt**, **textLogFmt**, **dataDictLog**, and **ddMapLog**, respectively.

- s name** Changes the **systemLog.h** file to **name**
- c name** Changes the **cmpLogFmt** file to **name**
- t name** Changes the **textLogFmt** file to **name**
- d name** Changes the **dataDictLog** file to **name**
- m name** Changes the **ddMapLog** file to **name**

The **systemLog.h** file contains a series of defines of the form:

```
#define _{FILE}_START NN
```

where *{FILE}* is the all-uppercase form of the input file name. This header file allows applications to refer to errors of a specific class relative to the beginning of the class of errors and so avoid having to edit code as the various classes of errors codes grow or shrink.

The **cmpLogFmt** file contains the compressed formats, which the log subroutine uses to produce compressed logging messages.

The **textLogFmt** file contains two sections. The first section is a series of offsets to each expansion format and its length. The second section contains

the expansion formats, which **expandLog** uses to convert a compressed logging file into a human-readable statement.

The **dataDictLog** file contains SQL names for the variable fields in each message. They are of the form:

abs_index <FS>fld-name,type[,length[,precision]]<FS>...<GS>

The *abs_index* is the index number of the message within the universe of all messages compiled by **IComp**. If the optional SQL specification does not appear after the format, **IComp** generates one of the form:

CLASSNNN_M,type[,len[,precision]]

based on the format. **CLASS** is the all-uppercase name of the file the message came from, **NNN** is the index of the message within the file, and **M** is the field within the message, starting at 1.

The **ddMapLog** file contains structures describing where to find each data dictionary entry for each message. It also contains an array with the class names.

logCat

list

The **list** command lists the directory entries for specific phrases in the UNIX file (SSP [only](#)).

Synopsis

```
list -l [phrase <phrase list> ] [in] [talkfile <talkfile list> ]
```

Description

The **list** command displays the phrases stored in the specified talkfile. The valid arguments for the **list** command are:

- **<phrase list>** — Specifies the number (or range) of the phrase or phrases to be listed. To list all phrases in a particular talkfile, enter **all** for *<phrase number>*.

The following example displays all phrases in talkfile 104:

```
list phrase all in talkfile 104
```

- **<talkfile list>** — Specifies the number (or range) of the talkfile or talkfiles containing the phrase or phrases to be listed. To list a particular phrase number in all talkfiles, enter **all** for *<talkfile number>*.

The following example displays phrase 1010 in all talkfiles:

```
list phrase 1010 in talkfile all
```

The listed entries are sorted by talkfile number and phrase. The information printed for each phrase consists of talkfile number, phrase number, phrase size in bytes, phrase size in blocks, the phrase length in seconds, and the speech coding type.

Note: The **list** command lists the directory entries for specific phrases in the SPEECHDIR default directory, which is **/home2/vfs/talkfiles**.

Examples

The following example displays phrase 174 as stored in talkfile 25.

```
list phrase 174 in talkfile 25
```

The following example displays phrase 12 as stored in talkfile 1.

```
list phrase 12 in talkfile 1
```

The following example displays all phrases stored in all talkfiles:

```
list phrase all in talkfile all
```

logCat

The **logCat** command reads the compressed logging files and outputs human readable messages.

Synopsis

```
logCat [-t|b] lines] [-a locant] [-z locant] [-v] [-c] [-m] [-r root]
        [-s locant] [-q locant] [-w width] [-p continuation-prefix]
        [-d data -l log-prefix | file] [-f format] [-V]
```

Description

The **logCat** command reads in a file of compressed logging messages generated by **log** and expands them to a readable format.

The default action, with no arguments, is to list all log files of the type specified first in the Config file. For example, **logCat -d\${LOGROOT}/data -l{primary-log-prefix}**. The options are as follows:

- **-t lines** — Tails the last “lines” of file.
- **-b lines** — Shows the beginning “lines” of file.
- **-v** — Specifies the verbose mode (that is, report the file names of the files examined).
- **-c** — Continuously displays the last lines of file. If the **logdaemon** switches to a new file, follow it.

- **-m** — This option is the meticulous time check. Normally, the log file name and the creation date are used to determine the date of the file. If the creation dates have been messed up, the **-m** flag causes the time stamp of the first message in each log file to be used instead of the name and modification date. This is slower but more reliable.
- **-r root** — Specifies an alternate root directory for **textLogFmt** file. The default is **/usr/spool/log**. Also, the **data** directory containing the compressed logging data files is expected to be in the root directory if not overridden by the **-d** flag or the LOGDATA environment variable.
- **-a locant** — Specifies the place to start printing.
- **-z locant** — Specifies the place to stop printing.
- **-s locant** — Searches for specific patterns or times.
- **-q locant** — Searches for specific patterns or times. This is the same as **-s** if the locant is a time locant. If the locant is a search pattern, the search is applied to the raw compressed log data instead of the expanded log data. This means that the pattern can only include variable portions of the logged messages. It is much faster than the **-s** option when properly applied.

A locant is one of two things, either a date/time stamp or a search pattern.

Dates can be any of the standard readable formats: mmm dd, yyyy, mm/dd/yy, mm-dd-yy, and so on. The time is hh:mm:ss. It is also possible to specify the separate elements as follows: sec=nn min=nn hour=nn

mday=mm mon=nn or mon=mmm year=nn[nn] wday=n or wday=ddd
yday=nnn. Portions left out default to this date, 0 hours, 0 minutes, and 0 seconds; that is, giving only the time of day indicates today's date. If the form "item=xxx" is used, all elements not specified default to "*"; hence "wday=Sun" means all messages on any Sunday. Do not mix standard format with the "item=xxx" format. The results are not predictable.

Spaces should be enclosed in quotes, for example, **-a"7/14/87 05:08:30"**. Search patterns are enclosed in forward slash (/) characters, with an optional repetition count following, for example, **-z/GEN006/2** means the second message containing GEN006. The repetition count has no meaning with the **-s** or **-q** locants, but does for the **-a** and **-z** locants.

The search capability supports the following meta-search constructs:

- ^ Beginning of message
- \$ End of message
- * Any number of unspecified characters
- ? A single unspecified character
- [xxx] Any character in the list "xxx"
- [!xxx] Any character not in the list "xxx"
- \{chr} Normal C backslash conventions, \n \t \b \f \r \NNN \\ \V \[

- **-w width** — If lines are to be wrapped, this is the width at which the wrapping should take place. 0 means no wrapping and is the default. The width can also be supplied via the environment variable LOGCOLUMN.
- **-p continuation-prefix** — This is the string to be appended to each continuation line. The default is no continuation prefix. The continuation prefix can also be provided via the environment variable LOGCONTPREFIX data.
- **-d data** — This option is the name of the directory to find the log files in. The data directory can be provided in the environment variable: LOGDATA. The default is **\${LOGROOT}/data**. The **-d** argument takes precedence over the environment variable.
- **-l log-prefix** — Prefix of the log files to examine. The default is the first log file in the **Config** file. The log-prefix can also be provided via the environment variable LOGFILEPREFIX file.
- **file** — Explicit file to be displayed. If “-”, use standard input. The use of a file name overrides the **-d** and **-l** options.
- **-f format** — Format specification for printing messages. The default is **%P %T %N %S:%L\n%M**

The format specifier uses the following notations:

%P(...) Priority level format: %d or %s

%T(...) Time level format: all options supported by “date” command

%N	Name of process specified by the loginit call of the process
%S	Source file name
%L	Line number
%M	Message text
%%	The % character
\{chr}	Standard C backslash conventions
...	All other characters are printed as is. The format can be provided via the environment variable LOGFORMAT.

- **-V**— This option makes the control characters visible. They are printed as `\X` if they have a special C notation. Otherwise, they are printed as `<NNN>`, where `NNN` is the octal value.

Environment Variables

Environment variables are checked whenever the related command argument is missing from the command line. If both the command argument and the environment variable are missing, the specified default is used.

LOGROOT

This variable is the directory in which the **textLogFmt** is found, containing the expansion formats. Also, the directory in which the **data** directory is found if LOGDATA is not specified.

LOGDATA

This variable is the directory in which the log data files are found. The default is **`\${LOGROOT}/data`**.

LOGFORMAT

This variable is the format in which to print the log messages. The default is **%P %T %N %S:%L n%M**.

LOGCOLUMN

This variable is the column at which to wrap long expansions. The default is 0, meaning do not wrap long messages.

LOGCONTPREFIX

This variable is the string to be prepended to continuation lines when long lines are being wrapped. The default is no prefix.

LOGFILEPREFIX

This variable is the logfile prefix to be examined if no **-l** argument is specified. If neither a **-l** argument is specified nor LOGFILEPREFIX set, then the first log destination in the Config file of the type 'L' is used.

IComp

logDstPri

The **logDstPri** command creates the shared memory containing the dynamic destinations and priorities of logging messages using the **logMsg()** interface.

Synopsis

logDstPri *[-H {dir}] [-c] [-v] [-d] [-x {cnt}] [rules]*

Description

The **logDstPri** *command* reads an ASCII rules file, described in **msgDst**, and then sets up a shared memory segment using the information in the rules file. In this way, any process in the system using the **logMsg ()**, **vlogMsg ()**, or **logSysError ()** library calls can determine the appropriate priority and logging destinations for each message they send.

By default, the rules files are expected to appear in **\${LOGROOT}/msgDst.rules**, where **\${LOGROOT}** is **/usr/spool/log**. By default, the header files used to translate ASCII names of message indices into numbers are expected to appear in the directory **\${LOGROOT}/head**. An alternate directory for the header files can be specified via the **-H** option on the command line. An alternate rules file can be specified as a file name on the command line.

After changing the rules file, it is recommended that the rules be checked before they are put into service. The `-c` flag causes **logDstPri** to read the rules file and report any rules that are misformatted or not understood. The return value from **logDstPri** is the number of errors detected.

To see the error complaints and install the rules all at once, specify the `-v` flag. This causes the verbose complaints to be generated. The `-c` flag implies the `-v` flag.

When **logDstPri** is resetting the values in shared memory, as opposed to creating the shared memory for the first time, it can be requested to delete the old shared memory and create a new segment by specifying the `-d` flag. Do not use the `-d` flag on a running system because any process that is already using the old shared memory continues to use it even after it is “deleted.” This means that two different rules files might be in force at the same time. It may be necessary to specify the `-d` flag if a large number of new messages have been added to the rules file. Currently, **logDstPri** creates the shared memory 200 entries larger than the highest logging message index found in its rule file. This means that as long as the new rules file does not go beyond 200 entries higher than the current highest entry, everything is okay. The number of extra entries can be altered by specifying the `-x` option.

Files

<code>#{LOGROOT}</code>	Default is <code>/usr/spool/log</code>
<code>#{LOGROOT}/msgDst.rules</code>	The message priority and destination file
<code>#{LOGROOT}/head/*.h</code>	Header files used by the logging system

Shared Memory Segment

The shared memory segment is keyed off the inode of the rules file and the define symbol `LDP_KEY`, defined in `log/head/logDstPri.h`. The library routine `ftok({file},LDP_KEY)` is used to generate the shared memory key.

`msgDst`

logEvent/logMsg

The `logEvent/logMsg` command allows shell scripts to log a specific message.

Synopsis

```
logEvent [script] [msg] [dst] [pri] [srcFile] [srcLine] <arg1> ...  
logMsg [script] [msg] [srcFile] [srcLine] <arg1> ...
```

Description

The `logEvent/logMsg` command allows shell procedures to log messages using specific messages. This is opposed to the `logit` command, which

generates messages within the logging system, but which always uses SYSMSG as the message format for the messages it generates. The **logEvent** command emulates the logEvent() library routine, while the **logMsg** command emulates the logMsg() library routine.

The **logEvent** command requires a destination and a priority when it is called. Messages logged via this interface are explicitly logged to the specified destinations and at the specific priority.

The logMsg command does not take a destination mask or a priority. It gets these pieces of information from the logging destination and a priority shared memory maintained by the **logDstPri** command via the **/usr/spool/log/msgDst.rules** file.

Both **logEvent** and **logMsg** require that the proper number of arguments be supplied for the specified message and that numeric arguments in the message format match pure numbers from the argument list. For example:

```
GEN012 OUT_OF_RANGE %D<<value,D>> is out of range \ for  
%s<<arg,S>> in %s<<routine,S>>.
```

This format requires that the first argument be a number, therefore,

```
logMsg XXX LG_OUT_OF_RANGE -- yes var compute
```

will fail because “yes” is not a number, while

```
logMsg XXX LG_OUT_OF RANGE -- 10 var compute
```

will not fail.

[Table 33](#) defines the command line arguments.

Table 33. Argument Descriptions for logEvent/logMsg

<i>script</i>	Name of the shell script for which the message is being logged. Normally, this is either basename\$0 or in ksh \${##*/}
<i>msg</i>	The symbolic name of the message, for example, LG_OUT_OF_RANGE
<i>dst</i>	This is only used with the logEvent command. It is the bit mask specification of where the message will be sent. It can be a number or symbolic destinations, as specified in <i>msgDst.rules</i> . If more than one symbolic destination is specified, they should be concatenated with a plus sign (+), for example, stderr+log
<i>pri</i>	The priority of the message. This is only used with the logEvent command. It may be any of the following: 0, - or NONE, 1, M or MANUAL, 2, * or MINOR, 3, ** or MAJOR, 4, *C or CRITICAL
<i>srcFile</i>	The name of the file from which the logEvent or logMsg command is being issued. If you do not care, you can use "-." Supplying the correct value is useful for debugging purposes, particularly if a script might generate the same message from more than one place. If there are many individual functions within your script, you might find it advantageous to use the name of the function instead of the file.

1 of 2

Table 33. Argument Descriptions for logEvent/logMsg

srcLine	The line within the file from which the logEvent or logMsg command is being issued. If you do not care, you can use "-." You might use \$LINENO from the ksh environment, which is the line with the script or within a function.
arg1	<p>For each argument required by a specific message format, one and only one argument is required. Neither too many or not enough is acceptable. Also, the size and type of the argument must be appropriate:</p> <p>%s (takes any kind of argument)</p> <p>%d %u %o %x %X (argument must be a pure integer type number, for example, -10, 5, 0177, 0x8e)</p> <p>%f %e %g %E %G (argument will be interpreted as a pure floating point number, for example, 15, 15.3, 1.56E3)</p> <p>%c (argument must be a single character, for example, x, 5, %)</p>

logFmt

The **logFmt** command displays and changes the parameters used to display messages and explanation texts, specifically the messages mnemonics and screen width.

Synopsis

logFmt [*global*] {*display*|*interactive*}[*opt*]={*value*}

Description

Each logging message has a class name and a mnemonic name associated with it. A class name, for example ICK001, is the combination of the name of the class, for example, ICK, and the index of the message within the class, for example, 001. The mnemonic name is a short composite string of characters that identifies the type of logging message. The mnemonic name for ICK001 is ICK_BAD_CMD. By default, the mnemonic names of messages are not displayed when **display messages** is used to examine the logging files. If you want the mnemonic message names to appear, then **logFmt** allows you to alter the system so that they either appear for everyone by default or appear for you specifically.

You can also adjust the width of the screen display. By default the screen width is set to 75 characters. If you have a wider screen, you might want to specify that more of the screen be used to display messages.

[Table 34](#) defines the **logFmt** command line arguments.

Table 34. Argument Descriptions for logFmt

Argument	Description
<i>global</i>	This modifier causes the action specified to operate on the “global” (system-wide) parameters that control the behavior of display message . You must be root if you want to change the global parameters. You can examine the global parameters without being root .
<i>display</i>	This verb causes logFmt to display the current parameters. If <i>global</i> is specified, then the system-wide parameters are displayed. Otherwise, your personal parameters are displayed.
<i>defaults</i>	Specifying <i>defaults</i> without the <i>global</i> option causes your personal preferences about mnemonics and screen width to be removed. You then get the system-wide settings. Specifying <i>defaults</i> with the <i>global</i> option causes the system-wide settings to be reset so that mnemonics are off and the default screen width is 75 characters.
<i>interactive</i>	This option interactively prompts for the parameters controlled by logFmt . Pressing ENTER in response to any query causes the current value to be retained. The current value appears within square brackets ([]).

1 of 2

Table 34. Argument Descriptions for logFmt

<i>mnemonics=enable</i>	This option causes mnemonics to be displayed when logging messages are examined with display messages .
<i>mnemonics=disable</i>	This option causes mnemonics not to be displayed when logging messages are examined with display messages .
<i>width=NN</i>	This option causes the screen width to be set to <i>NN</i> , where <i>NN</i> is between 40 and 199 columns. The default setting is 75. Do not attempt to set the screen width to a value wider than your screen can actually handle or the display will be unpleasant when using display messages .
<i>2 of 2</i>	

When mnemonics are enabled, they also show up when **explain** is used to examine the description of a message. Whether mnemonics are enabled or not, the mnemonic name can always be used to select an explanation using **explain**.

Files

/vs/data/logFmtParms	# Global parameters file
\${HOME}/.logFmtParms	# User's parameter file
/usr/spool/log/textLogFmt	# Current default expansion format file
/usr/spool/log/textLogFmt.Mne	# Expansion file with mnemonics
/usr/spool/log/textLogFmt.NoM	# Expansion file without mnemonics

Examples

The following example enables the mnemonics. This affects only you and overrides the system-wide setting.

logFmt mnemonics=enable

The following example sets the system-wide default so that mnemonics are not displayed. Any user who wants to see mnemonics has to personally enable them. You need to be *root* to execute this command.

logFmt global mnemonics=disable

The following example displays the system-wide settings for mnemonics and screen width.

logFmt global display

The following example sets your personal screen width to 130 characters when displaying messages using **display messages**.

logFmt width=130

mkAlerter

The **mkAlerter** command reads an alerter description and generates C or C++ code that implements the description.

Synopsis

```
mkAlerter [-M] [-o {executable}] [-p {templ-path}] [-t [-f]] [-q]
[-v] [-I] [X=Y...] [{alerterfile}.A...]
```

Description

The **mkAlerter** command is a program that reads an alerter description and translates it, with the help of code template files, into compilable C or C++ code. It also produces a make file for compiling the code. Alerter description files always have a ".A" extension. By default, **mkAlerter** produces a single source file, with an extension of ".c". It also produces a header file (extension ".h") and a make file (extension ".mk"). If the make file already exists, **mkAlerter** does not overwrite the existing file. This allows you to modify the make file as desired without fear of it being destroyed the next time **mkAlerter** is used, but does take advantage of the knowledge contained in the make file template used by **mkAlerter** when it does create a make file. The source file and the header are *always* overwritten each time **mkAlerter** is run. No modifications should ever be made to these intermediate source files, since the changes are lost the next time **mkAlerter** is run. If the **-M** flag is specified at execution time, **mkAlerter** splits the source file produced into two

pieces, one containing *main ()* and the other containing everything else. The source file containing *main ()* ends in “*Main.c*” with truncation as necessary. Once produced, this file, like the make file, is be overwritten. If you want to produce your own initialization, you can use the *-M* option and then make your changes to the “**Main.c*” file.

Normally, the make file specifies that the executable to be produced by this alerter description is the same as the name of the alerter description minus the “.A” extension. The *-o* option allows you to specify an alternate executable name. This is used when the make file is generated.

The code template files are normally expected to exist either in the current directory or in */usr/lib/alerter*. If the templates are not found in either of these places, **mkAlerter** uses its own internal copies, but also reports the fact. If the templates exist elsewhere, an alternate path can be specified with the *-p* option. Each directory that should be searched is separated by a colon (:), the same as a normal UNIX description.

To get the initial template files, the user can specify the *-t* option. This causes **mkAlerter** to create each of the required template files using its internal copies. At this point each site may, if desired, alter these templates to produce alerter code appropriate for its needs. By itself the *-t* flag does overwrite existing template files. The *-f* flag causes the new templates to overwrite existing ones.

The following is a current list of template files and their contents:

AlertInc.t	Description of include files.
AlertCopyR.t	Copyright notice.
AlertHead.t	Template of the header file.
AlertMain.t	Description of main () function.
Alerter.t	Primary template describing the alerter program.
AlertTest.t	Description of the code to respond to timeouts for alerting.
AlertMsg.t	Template describing a subroutine to process messages for a particular logging destination.
AlertDir.t	Template describing the subroutine to handle logging messages sent directly to the alerter process.
AlertMk.t	Template for the makefile.
AlertObj.t	Template for each *.o file in the makefile.

The `-q` option is not currently implemented. It is meant to check the templates for completeness. The `-v` flag increases the verbosity of **mkAlerter** while it performs some of its activities.

Normally **mkAlerter** produces *#line* directives, which are used by the C compiler to report where errors are detected during compilation. While these are good during the compiling phase, they mislead most debuggers and make debugging difficult. The *-l* option suppresses the *#line* directives and is recommended when the debugging phase includes the use of a process debugger, such as **sdb** or **pi**.

It is also possible to specify variable assignments that appears in the make file via the X=Y syntax. Of particular interest is CC=CC, which also causes **mkAlerter** to generate C++ code rather than C code.

readAlerterDesc

mkheader

The **mkheader** command allocates user memory for script variables.

Synopsis

mkheader <*application name*>

Description

The **mkheader** program creates an address in user memory for each script variable. This information is stored in an ***application-name def.h*** header file and is used in naming both the output file and the allocation program. The joint usage of the same header file enables the script to interact with the transaction state machine (TSM). The **-e** option specifies exact string matches.

The **mkheader** program prompts an operator to enter three types of information at the system console. The information may be entered interactively or batched together in a single file. Interactive entries are ended by entering **CONTROL + D**. The system prompts for:

- Variable names
- Header file names in order of dependency
- Structure names with header file locations

When **mkheader** is entered with an argument (limited to 7 characters) for *application-name*, an ***application-name def.h*** header file is created for the output information. The **mkheader** program then prompts for three types of information which it uses in producing the output file.

- It prompts the operator for the name of one of the variables char, int, or short. Char is the only variable that requires a length (default = 1).

It then allocates space for the variables at the beginning of the allowable user memory and places this information in the newly created header file.

- It prompts the operator to enter header files that are needed to make the files covered in the third section compile. They should be named in the order of dependence. For example, if information in the header file **b.h** is needed by the header file **a.h**, header file **b.h** must be entered first and then header file **a.h**.

Full pathnames must be given. The file **mesg.h** and the structure **mbhdr** are common to all scripts and are entered automatically.

The header files can be stored in a batch file. The batch file could contain the following header files:

```
#include "/att/msgipc/dbcom.h"  
#include "/att/include/shmemtab.h"  
#include "/att/msgipc/tsm stop.h"  
#include "/att/msgipc/cdata.h"
```

- This last prompt is used for allocating the space for each structure. It prompts the operator to enter each header file name and its structure names. For each header file, the operator enters the word "all" (if all structures are needed) or specific structure names.

Mkheader recursively allocates memory and produces **application-name def.h** defines for structure members which are themselves structures (except for struct **mbhdr**).

As a shortcut, the input for the three prompts may be stored in another file (data file) and read in each time. For example:

mkheader *application_name* < data file

Once the header files are entered, **mkheader** writes a program called ***application_name_aloc.c*** to allocate the rest of user memory. The resulting source code is automatically compiled, using **mkheader.a** library functions, and then executed. This adds the remaining structure definitions to the ***application_name_def.h*** header file. TSM does not allow a script to use more than 50,000 bytes of user memory. Scripts that exceed this limit are not run when data beyond the limit are accessed.

Files

/vs/bin/vs/mkheader
/vs/bin/vrs/mkheader.a

Examples

The following are examples of the prompts and the output for the **mkheader** program. This example shows a user who needs some space for 20 characters, 2 integers, and a short variable. The user also needs to have space declared for a structure called **dowj**, which is used by the script. The header file is found in ***/att/msgipc/tsmdipappl.h***.

In the example, the structure size of **SZDOWJ** is 16, which is automatically supplied by **mkheader**.

console input: **mkheader** *<application_name>*

FIRST PROMPT: Type in the variables you need space for according to the following format:

type name [length]

Example 1: int yn

Example 2: char dg 20

(End input with CTRL-D)

Variable?: char dg 20

Variable?: int yn

Variable?: short cid

Variable?: int iom

Variable?: (CTRL-D)

SECOND PROMPT: Please enter any dependency files that the header files in the next section will need in order to compile. Use full path names. (End input with CTRL-D)

File name? /u/factory/file.h

File name? (CTRL-D)

THIRD PROMPT: Enter the header file name and structure names needed to create the def.h file. Use full path names. (End input with CTRL-D)

Header file?: /att/msgipc/tsmdipappl.h

Structures or all?: dowj

Header file?: (CTRL-D)

Compiling: application-name alloc.c

Running: application-name alloc

Output is called: application-name def.h

This is the final *application_namedef.h* file produced by this example.

```
/*****PRE-ALLOCATION OF USER SPACE *****/
```

```
#define DG:0
```

```
#define YN:20
```

```
#define CID:24
```

```
#define IOM:26
```

```
/***** DOWJ STRUCTURE *****/
```

```
#define DOWJ:30
```

```
#define RCODE:30
```

```
#define TIMEDATE:31
```

```
#define CATNUM:42
```

```
#define MKTSTAT:43
```

```
#define DOWHOUR:44
```

```
#define SZDOWJ:16
```

In this second example, the command line includes a data file from which the system gets the information usually entered by the users in response to system prompts.

The data file, called “data” in this example, contains the following information:

```
char name 20
int answer
short reply
^D
/att/include/shmemtab.h
^D
/att/msgipc/cdata.h
Day_pntr cdata
^D
```

The following appears on the screen:

```
Conversant% mkheader test6 < data
```

Type in the variables you need space for according to the following format:

```
type name [length]
Example 1: int yn
Example 2: char dg 20
(End input with CTRL-D)
```

Variable?:
Variable?:
Variable?:
Variable?:

Please enter any dependency files that the header files in the next section will need in order to compile. Use full path names. (End input with CTRL-D)

File name?: File name?:

Enter the header file names and structure names needed to create the def.h file. Use full path names. (End input with CTRL-D)

Header file?: List of structures or all?:Header file?:

Compiling /usr/has/another/test6_alloc.c

Running /usr/has/another/test6_alloc

Output is called /usr/has/another/test6def.h

I am now checking for any duplicate defines that will cause problems.

The following is the contents of the test6def.h file:

```
/****** PRE-ALLOCATION OF USER SPACE *****/  
  
#define NAME:0  
#define ANSWER:20  
#define REPLY:24
```

```
/****** DAY_PNTR STRUCTURE *****/  
  
#define DAY_PNTR 26  
#define FILE_FIRST 26  
#define REC_FIRST 28  
#define FILE_LAST 30  
#define REC_LAST 32  
#define SZDAY_PNTR 8  
  
/****** CDATA STRUCTURE *****/  
  
#define CDATA 34  
#define SCRIPT 34  
#define CHAN 50  
#define EQUIP 52  
#define STARTTIME 54  
#define STOPTIME 58  
#define EV0 62  
#define EV1 66  
#define EV2 70  
#define EV3 74  
-:  
-:  
-:  
#define EV96446  
#define EV97450  
#define EV98454
```

```
#define EV99458  
#define SZCDATA428
```

Note: Make sure that all variable names are unique without respect to case because lowercase letters are changed to uppercase for the final output.

mkimage

The **mkimage** command performs a complete system backup of all the contents of the root disk file system.

Note: **Mkimage** performs only complete backups. The option to perform a partial backup of the root disk file system is no longer available.

Synopsis

mkimage

Description

The **mkimage** command performs a complete system backup by copying the UNIX files in the **root** and **usr** file systems to cartridge tape.

Note: This command can only be run from the **root** directory.

When specifying the **mkimage** command, the voice system requests that the system be placed into single-user mode. The **mkimage** command aborts if you do not give the system permission. Once in single-user mode, you must log in again and reexecute the **mkimage** command to continue the **mkimage** process. The **mkimage** unmounts all mountable file systems and then mounts **/usr**, **/var**, **/home**, and **/home2** file systems, which are the only file systems beside the root file system and **/stand** that appear on the root disk in a standard voice system. The system then creates a list of files to archive to tape and prompts you to insert a tape.

 **CAUTION:**

Do not rename the file systems mentioned above as the newly named file system would not be included in the image tape.

Once the image creation has finished, the tape is verified by reading the table of contents from the tape and comparing it with the original list of files used to create the tape. If any errors are found, you see the following message that directs you to check for specific files for further information about the failure:

ERROR:Verification failed. Wait for the light on the tape unit to go off before removing the tape.

Three files have been written to the **/tmp** directory which show the results of the backup and verification. **\$DISK_FILES** contains a list of all the files which were to be backed up. **\$TAPE_TOC** contains a list of all files which were

actually written to the tape. \$DIFFOUT contains the difference between these two files.

Analysis of these files may help in understanding the nature of the failure.

Also, be sure you are using the supported cartridge type and that your tape drive is being cleaned regularly. Execute the **-init 6-** command to return to multiuser mode.

The **mkimage** command then returns the voice system to multiuser mode by rebooting. If no errors are found, you are prompted to make a note of the file system partition sizes after the voice system returns to multiuser mode.

Note: You do not get a warning from the voice system before it reboots to return to multiuser mode.

Note: The **mkimage** command can run anywhere from 45 minutes to one or more hours creating the image tape. Several tapes could be required depending on the amount of space used in the root disk file systems.

Note: The complete system image tape should only be used to restore a system root disk that has been severely damaged and needs file-system reconstruction at the lowest level. Use the **backup** and **restore** commands to recover from minor file damage or corruption.

Example

The following example backs up the **root** and **usr** file system to cartridge tape:

```
mkimage
```

newscrip

The **newscrip** command updates the changes to all currently assigned scripts.

Synopsis

```
newscrip
```

Description

The **newscrip** command notifies the TSM and CDH processes that an existing script in the **/vs/trans** directory has been changed. After **newscrip** is run, TSM reloads all scripts from disk the next time it is run instead of using a copy in the system memory.

Files

```
/vs/bin/util/newscrip
```

Example

The following example notifies the TSM and CDH processes that an existing application in the directory **/vs/trans** has changed.

```
newsript
```

pkgadd

The **pkgadd** command transfers a software package to the voice system.

Synopsis

```
pkgadd [ -n ] [ -a admin ] [ -d device ] [ -R rootpath ] [ -r response ]  
[ pkginst1 [ pkginst2 ] ... ]
```

```
pkgadd -s spool [ -d device ] [ pkginst1 [ pkginst2 ] ... ]
```

Description

pkgadd transfers the contents of a software package from the distribution medium or directory to the system. Used without the -d option, **pkgadd** looks in the default spool directory for the package (**/var/spool/pkg**). Used with the -s option, it reads the package to a spool directory instead of installing it.

The `pkgadd` command has the following parameters:

Note: When executed without options, **pkgadd** uses `/var/spool/pkg` (the default spool directory).

When transferring a package to a spool directory, the `-r`, `-n`, and `-a` options cannot be used.

- **-a** — Define an installation administration file, `admin`, to be used in place of the default administration file. The token `none` overrides the use of any `admin` file, and thus forces interaction with the user. Unless a full path name is given, **pkgadd** looks in the `/var/sadm/install/admin` directory for the file.
- **-d** — Install or copy a package from device. Device can be a full path name to a directory or the identifiers for tape, floppy disk, or removable disk (for example, `/var/tmp` or `/floppy/floppyname`). It can also be a device alias (for example, `/floppy/floppy0`).
- **-n** — Installation occurs in noninteractive mode. The default mode is interactive.

Note: The `-n` option causes the installation to halt if any interaction is needed to complete it.

- **pkginst** — Specify the package instance or list of instances to be installed. The token `all` can be used to refer to all packages available on the source medium. The format `pkginst.*` can be used to indicate all instances of a package.

- **-r** — Identify a file or directory that contains output from a previous pkgadd session. This file supplies the interaction responses that would be requested by the package in interactive mode. Response must be a full path name.

Note: The **-r** option can be used to indicate a directory name as well as a filename. The directory can contain numerous response files, each sharing the name of the package with which it should be associated. This is used, for example, when adding multiple interactive packages with one invocation of **pkgadd**.

Each package needs a response file. If you create response files with the same name as the package (that is, pkinst1 and pkinst2), then name the directory in which these files reside after the **-r**.

- **-R** — Define the full path name of a subdirectory to use as the rootpath. All files, including package system information files, are relocated to a directory tree starting in the specified rootpath.
- **-s** — Reads the package into the directory spool instead of installing it.

Examples

The following example installs a package from a floppy diskette. The system prompts you for the name of the package you want to install.

```
pkgadd -d diskette1
```

pkginfo
pkgrm

pkginfo

The **pkginfo** command displays software package information.

Synopsis

```
pkginfo [ -q | -x | -l ] [ -p | -i ] [ -r ] [ -a arch ] [ -v version ] [ -c category1,  
[ category2 [ , ... ] ] ] [ pkginst [ , pkginst [ , ... ] ] ]
```

```
pkginfo [ -d device ] [ -R rootpath ] [ -q | -x | -l ] [ -a arch ] [ -v version ]  
[ -c category1 , [ category2 [ , ... ] ] ] [ pkginst [ , pkginst [ , ... ] ] ]
```

Description

pkginfo displays information about software packages that are installed on the system (with the first synopsis), or that reside on a particular device or directory (with the second synopsis).

pkginst designates a package by its instance. An instance can be the package abbreviation or a specific instance (for example, inst.1 or inst.beta). All instances of package can be requested by inst.*.

Without options, **pkginfo** lists the primary category, package instance, and the names of all completely installed and partially installed packages. It displays one line for each package selected.

The parameters for the **pkginfo** command are:

Note: The **-p** and **-i** options are meaningless if used in conjunction with the **-d** option.

The options **-q**, **-x**, and **-l** are mutually exclusive.

- **-a** — Specify the architecture of the package as arch.
- **-c** — Display packages that match the category. Categories are defined in the category field of the **pkginfo** file. If more than one category is supplied, the package needs to match only one category in the list. The match is not case specific.
- **-d** — Define a device on which the software resides. Device can be an absolute directory path name or the identifiers for tape, floppy disk, removable disk, and so forth. The special token spool may be used to indicate the default installation spool directory (**/var/spool/pkg**).
- **-i** — Display information for fully installed packages only.
- **-l** — Specify long format, which includes all available information about the designated package or packages.
- **-p** — Display information for partially installed packages only.

- `pkginst` — Specify the package instance or list of instances to be installed. The token `all` may be used to refer to all packages available on the source medium. The format `pkginst.*` can be used to indicate all instances of a package.
- `-q` — Do not list any information. Used from a program to check whether or not a package has been installed.
- `-r` — List the installation base for relocatable packages.
- `-R` — Define the full path name of a subdirectory to use as the root path. All files, including package system information files, are relocated to a directory tree starting in the specified root path.
- `-v` — Specify the version of the package as `version`. All compatible versions can be requested by preceding the version name with a tilde (`~`). Multiple white spaces are replaced with a single white space during version comparison.
- `-x` — Designate an extracted listing of package information. The listing contains the package abbreviation, package name, package architecture (if available) and package version (if available).

pkgadd
pkgrm

pkgrm

The **pkgrm** command removes a software package from the voice system.

Synopsis

```
pkgrm [ -n ] [ -R root dir ] [ -a admin ] [ pkginst1 [ pkginst2 ] ...]
```

```
pkgrm -s pool [ pkginst ]
```

Description

pkgrm removes a previously installed or partially installed package from the system. A check is made to determine if any other packages depend on the one being removed. If a dependency exists, the action taken is defined in the *admin* file.

The default state for the command is in interactive mode, meaning that the system displays messages during processing to allow the administrator to confirm the actions being taken. Noninteractive mode can be requested with the -n option.

The -s option can be used to specify the directory from which spooled packages are to be removed.

Options

The **pkgrm** command has the following parameters:

- **-n** — Noninteractive mode. If there is a need for interaction, the command exits. Using this option requires that at least one package instance be named when the command is invoked.
- **-R** — Define the full path name of a subdirectory to use as the root path. All files, including package system information files, are relocated to a directory tree starting in the specified root path.
- **-a** — Use the installation administration file, *admin*, in place of the default *admin* file.
- **-s** — Removes the specified package or packages from the directory spool.
- **pkginst** — Specifies the package to be removed. The format **pkginst.*** can be used to remove all instances of a package.

pkgadd
pkginfo

reinitLog

The **reinitlog** command is the control program and is used to inform **logdaemon** that a new config file is to be used.

Synopsis

reinitLog

Description

The **reinitlog** command is used during the procedure of creating a new logger message destination. It sends a message to the **logdaemon** that informs it that a new config file is to be used. The **reinitlog** command causes the **logdaemon** to reread the configuration file and reopen the various logging files.

Files

\$LOGROOT/Config	The configuration file which defines destinations.
\$LOGROOT/data	The directory in which logging files are created.
\$LOGROOT/logpipe	The FIFO which logdaemon reads.

logit

remove

The **remove** command places a unit in the manual-out-of-service state.

Synopsis

```
remove <unit> <number> <immed> <min_delay> [-i] [-n]
```

```
rem <unit> <number> <immed> <min_delay> [-i] [-n]
```

Description

The **remove** command is used to remove a unit from service when its temporary state is idle. It changes the permanent state of the unit to manual-out-of-service (MANOOS). It does not remove a unit that has a temporary state of busy. If a unit must be interrupted immediately or appears to be stuck busy, use the **rem <unit> <number> <immed>** command.

The parameters for the **remove** command are:

- **<unit>** — Identifies the unit. The choices are “channel” or “card.”
- **<number>** — Specifies the channel or card number, a range of channel or card numbers in the form *m-n*, or the word **all** for all the channel or card numbers. Card numbers are in the form **card#[.port#]** where *port#* is a port of *card#*. If *port#* is not given, all ports of the card specified are removed. If no card number or channel number is given, the system displays a syntax message.

- **-n** — Disables prompting from the system whether to wait until a conflict is resolved (see the **-i** option below) or to terminate the request to remove.
- **-i** — Enables secondary command registration. If T1 diagnostics are being run, this option allows the removal of another card. If **-i** is used and another maintenance command is being run (**remove**, **detach**, **attach**, **restore**, **diagnose**), the request to **remove** card is blocked and a message is printed to the screen. If **-i** is not used and any maintenance command is being run, the request to **remove** card is blocked and a message is printed to the screen.

If the command is permitted to run, a check is made to see if the command is in conflict with another. A command is in conflict if the card or card associated with it:

- ~ Is the T1 card being diagnosed
- ~ Will cause a change in the existing TDM bus master assignment
- ~ Has an interdependency with the T1 card being diagnosed (for example, PRI)

If one of the above conflicts exist and **-n** is not used, the user is asked whether to wait until the conflict is resolved or to terminate the request. If T1 diagnostics are executing online tests and a conflict is detected, the **remove card** command is blocked. If T1 diagnostics are executing off-line tests and a conflict is detected, the user is asked whether to wait until the conflict is resolved or to terminate the request to remove.

- **immed** — Removes a card or channel even if it is in use. Active calls are likely to be dropped when this option is specified. This option is necessary when the card or channel must be removed from service as soon as possible, and you are willing to terminate any active calls. You may also want to use this option to get control of a channel that is hung and not providing useful service.
- **min_delay** — Used to avoid waiting for channels to be granted. This option applies to **remove chan** and **remove card** requests that are removing network interface channels, for example, T1. This option specifies to minimize the delay in removing channels from service by not waiting for the channel to be granted. This option speeds up execution of the **remove** command, especially when a large number of channels are currently active.

When using this option, you must display the status of the channels with the **display card** command to determine when they are in the MANOOS state. This option can be used with or without [the *immed* option and improves the response time in either case.](#)

 **CAUTION:**

Removing a large number of channels from service with the `min_delay` option may cause momentary load problems on the switch.

To delete out of the command, press **DELETE**. If this does not stop the command, you may need to press **CONTROL** and backslash simultaneously. If, while running **remove**, you want to abort the command, a message similar to the following may appear:

```
At the user's request, administration of the following  
cmd(s) has been interrupted.
```

```
CARD NUMBERS: <card numbers>
```

```
To assure proper operation of the identified card(s),  
run diagnostics at the earliest opportunity.
```

When **remove** is aborted, you should run diagnostics on all cards being administered to ensure they are returned to a fully functional state.

Example

The following example removes card 0 from service.

```
rem card 0
```

The following example removes channels 0 through 2 and channel 4 from service.

```
rem channel 0-2,4
```

The following example removes all cards from service.

```
rem card all
```

detach
restore

restore

The **restore** command restores a unit to the in-service state.

Synopsis

restore *<unit>* *<number>* [-i] [-n]

Description

The **restore** command is used to change the permanent state of a unit from manual-out-of-service (MANOOS) to in service (INSERV). The specified unit is placed in the INSERV state unconditionally, unless its current state is not MANOOS.

The parameters for the **restore** command are:

- **<unit>** — Identifies the unit. The choices are “channel” or “card.”
- **<number>** — Specifies the channel or card number, a range of channel or card numbers in the form m-n, or the word “all” for all the channel or card numbers. Card numbers are in the form *card#[.port#]* where *port#* is

a port of card#. If *port#* is not given, all ports of the card specified are restored. If no card number or channel number is given, the system displays a syntax message.

- **-n** — Disables prompting from the system, whether to wait until a conflict has been resolved (see the *-i* option below) or to terminate the request to restore.
- **-i** — Enables secondary command registration. If T1 diagnostics are being run, this option allows “restoring” of another card to be performed. If *-i* is used and another maintenance command is being run (**remove**, **detach**, **attach**, **restore**, **diagnose**), the request to **restore** card is blocked and a message is printed to the screen. If *-i* is not used and any maintenance command is being run, the request to **restore** card is blocked and a message is printed to the screen.

If the command is permitted to run, a check is made to see if the command is in conflict with another. A command is in conflict if the card or card associated with it:

- ~ Is the T1 card being diagnosed
- ~ Will cause a change in the existing TDM bus master assignment
- ~ Has an interdependency with the T1 card being diagnosed (for example, PRI)

If one of the above conflicts exist and *-n* is not used, the user is asked whether to wait until the conflict is resolved or to terminate the request. If

T1 diagnostics are executing online tests and a conflict is detected, the **restore** command is blocked. If T1 diagnostics are executing offline tests and a conflict is detected, the user is asked whether to wait until the conflict is resolved or to terminate the request to restore.

To delete out of the command, press **DELETE**. If this does not stop the command, you may need to press **CONTROL** and backslash simultaneously. If, while running restore, you want to abort the command, a message similar to the following may appear:

```
At the user's request, administration of the following  
cmd(s) has been interrupted.
```

```
CARD NUMBERS: <card numbers>
```

```
To assure proper operation of the identified card(s),  
run diagnostics at the earliest opportunity.
```

When **restore** is aborted, you should diagnostics on all cards being administered to ensure that they are returned to a fully functional state.

Example

The following example restores card 0 to service.

```
restore card 0
```

The following example restores channels 0, 1, and 5 to service.

```
restore channel 0-1,5
```

The following example restores all cards to service.

```
restore card all
```

remove

retireAlarms

Syntax

```
retireAlarms [-t] [-u user] [-r reason] ["selector" ... | ALL]
```

Description

Variables include:

- **-t** — Add alarm times to the display in interactive mode.
- **-u *user*** — Mark the alarms as retired by *user*. The default is \$LOGNAME.
- **-r *reason*** — Reason alarms are being retired.

- **selector** — Generally a regular expression identifying the alarms to be retired, though it can also be index numbers.
- **ALL** — Retire all currently active alarms.

Normally, **retireAlarms** operates in an interactive mode. If started with no arguments, it displays the currently active alarms and allows the user to select those to be retired. Selection can be by index number or by use of a matching pattern. To increase the number of alarms that can be displayed on a single screen, the time the alarm happened is not printed unless the **-t** flag is specified.

The **retireAlarms** command can be used as a line command if both a reason for the retiring is supplied and a selector. A **selector** is either a regular expression or a set of indices in the list which are to be retired.

A set of indices can be individual indices, optionally separated by white space or commas, or ranges of the form "m-n", where "m" is less than "n". For example, **2,4-6,VP** retires alarms 2, 4, 5, 6, and any one with the string VP in its "key."

dspRetAlarms

rmdb

The **rmdb** command displays the state of the resource manager (RM) and modifies the debug levels.

Synopsis

```
rmdb [-l] [-s] [-u] [-d <range>] [-g <range>] [-f <range>] [-p  
<range>]  
[-C <range>] [-T <range>] [-P <range>] [-i <interval>]  
[-tL <levelMask>] [-tA <levelMask>] [-tc <channel>] [-tC <channel>]
```

Description

The **rmdb** displays the state of the resource manager and modifies the debug levels. The valid syntax for ranges is as follows:

value [-value] [, value] | [value-value]*

Specifying a value an odd number of times indicates that it will be displayed. Specifying a value an even number of times indicates that it will not be displayed. For example, **7-10,9** will display the items associated with values 7, 8, and 10. The 9 entry is excluded since it was specified two times.

The **rmdb** command accepts the arguments shown in [Table 35 on page 565](#).

Table 35. Argument Description for rmdb

Variable	Definition
-l	Takes the rmLOCK while sampling data structures. This ensures that the sample is internally consistent. However, if the RM data structures are left in a locked state, this causes the rmdb to block until they are unlocked. (Leaving the rm data structures locked is a system fault). Also, other processes that attempt to use the RM data structures are temporarily blocked until rmdb completes its query.
-s	Prints the values of the RM parameters and debug variables.
-u	Prints the function's usage statistics.
-d	Prints device table entries by device number.
-g	Prints out group lists (by index in the group table).
-f	Prints out the function table (by index in the function table).
-p	Prints out the packfile table (by index in the packfile table).
-c	Prints out the card table (by card number in the card table).
-C	Prints out the channel table (by channel number).

1 of 2

Table 35. Argument Description for rmdb

Variable	Definition
-T	Prints out the channel touchtone queues (by channel number).
-P	Prints out channel profiles (by channel number).
-i	Repeats the display, with a sleep interval of the specified number of seconds between samples.

2 of 2

The **-tL <levelMask>** sets the trace level mask. Supported masks are shown in [Table 36](#).

Table 36. Rmdb Trace Level Masks

Mask	Value
RM_TL_ERROR	0x1
RM_TL_GENERAL	0x2
RM_TL_ENTEREXIT	0x4

The **-tA <levelMask>** sets the trace area mask. Supported masks are shown in [Table 37 on page 567](#).

Table 37. Rmdb Trace Area Mask

Mask	Value
RM_TA_TIMER	0x1
RM_TA_RESOURCE	0x2
RM_TA_INPUT	0x4
RM_TA_PROFILE	0x8
RM_TA_MTC	0x10
RM_TA_MSG	0x20
RM_TA_INTERNAL	0x40

The **-tc <channel>** sets the trace channel low end.

The **-tC <channel>** sets the trace channel high end.

show_sys

The **show_sys** command allows you to retrieve configuration and administration information from customer sites.

Synopsis

/vs/bin/tools/show_sys [-l]

Description

The following information can be retrieved with the **show_sys** command:

- UNIX version machine type
- Installed software
- Memory
- Configuration of hard disks
- Free space in UNIX file system
- Tunable parameter changes
- Free space in swap
- Free space in the speech file system
- Free space in the Oracle database

- Oracle database tables
- Directory files in **/oracle/dbs**
- Cron information for root
- Local and remote database information
- ASP driver (speech card) version
- DNIS information (if T1s are present)
- T1 card information (if T1s are present)
- Device Information
- SAR Snapshot
- Parallel Printer Information
- UUCP information
- Devices file
- Permissions file
- Systems file
- Installed cards
- Parameter file(s) for assigned applications
- Databases used in each application

- CCA report for the previous week
- Call data report for a specific day of the previous week
- Traffic report for a specific day of the previous week

The `-l` option prints details about each of the information that can be retrieved with the **show_sys** command.

Example

show_sys

soft_disc

The **soft_disc** command sends a disconnect to a script on a channel or channels.

Synopsis

soft_disc <channel>

soft_disc <channelStart-channelEnd>

Description

The **soft_disc** *command* sends a message or messages to TSM requesting that the script running on <channel> or the range of channels <channelStart-

channelEnd> be sent interrupt messages. If no script is running on the channel or if TSM does not own the channel, no action is taken for the channel.

The **soft_disc** *command* waits for a response from TSM. When it exits, TSM has acted on all the requests for all the channels by sending disconnects to the scripts or rejecting the requests. Scripts running on the channel receive the ESOFDISC event.

Return Values

If the **soft_disc** is successful, a 0 value is returned. If any other value than 0 is returned, the **soft_disc** command completely or partially failed. If **soft_disc** returns a value of 2, then **dip_int** command failed due to temporary condition. In this case, the user should attempt the **dip_int** command again.

Example

The following example requests that TSM send interrupt messages to channel 2.

```
soft_disc 2
```

The following example requests that TSM send interrupt messages to channels 1 through 32.

```
soft_disc 1-32
```

See Also

dip_int

soft_srz

The **soft_srz** command starts a script on a channel.

Synopsis

soft_srz <channelStart-channelEnd> <script>

Description

The **soft_srz** command can be used to start a script on a channel. The **soft_srz** command sends a message to TSM requesting that a script be started on a channel. If the channel is in use, the script is not started. **Soft_srz** waits for a response from TSM. When **soft_srz** exits, TSM has either accepted the request and started the script or rejected the request.

There are two arguments to the **soft_srz** command: <channel> and <script>. The <channel> argument specifies the channel or range of channels on which you want to start the script. The <script> argument specifies the script to be started. The script does not have to be in the table of assigned scripts.

The channel number(s) must be valid and the channel(s) must not be busy, and the channel(s) must be in the inserv state. If you specify a channel that is

busy, the command fails. If you specify a range of channels and one or more of the channels is busy, the command seizes the idle channels but fails for the busy channels.

Example

The following example starts the script “sodapop” on channels 0 through 4.

```
soft_srz 0-4 sodapop
```

The following example starts the script “test1” on channel 10.

```
soft_srz 10 test1
```

Return Values

If the **soft_srz** is successful, a 0 value is returned. If any value other than 0 is returned, the **soft_srz** command completely or partially failed. If **soft_srz** returns a value of 2, the **soft_srz** command failed due to temporary condition. In this case, the user should attempt the **dip_int** command again.

spadc

The **spadc** command collects data on the signal processing resources.

Synopsis

spadc [-m *min*] [-s *sec*] [-D *dir*]

Description

The **spadc** command executes a program that collects data on the voice system signal processing resource utilization. Data is sampled every **-s** seconds, and average and peak measurements are written to a file called **mm-dd-yyyy** for the day of the month and year on which the command was executed (for example, 09-12-1997). The file is written in the **-D** directory every **-m** minutes.

The **spadc** command uses the following options:

- **-m** — minutes; used to specify how many minutes of data are represented in each output line of the **mm-dd-yyyy** file.
- **-s** — seconds; used to specify how many seconds pass between each data collection. Valid entries are from 5 to 60. The default is 60.
- **-D** — directory; used to specify the directory for the output. The default is **/var/adm/spa**.

Example

spadc -m 20 -s 10

This command collects the signal processing resource data in 10-second increments for a total of 20 minutes.

See Also

spar

spar

The **spar** command is the signal processing resource reporter.

Synopsis

spar [-ablmp] [-t min] [-f file]

Description

The **spar** command executes a program that reports on the signal processing data activity collected by the **spadc** command.

The **spar** command options determine the report format:

- **-b** — board (circuit card)
- **-a** — algorithm

- **-l** — feature licensing
- **-m** — mean (average) data
- **-p** — peak data
- **-t** — time; used to specify how many minutes of data are summarized in each report line. The value must be 5 to 60, in increments of 5 (for example, 5, 10, or 15, and so on). The default is 20. To ensure valid data, the value for **-t** should be equal to or greater than the time increment specified for data collection by the **spadc** command.
- **-f** — file; used to specify an input data file. If no **-f** argument is given, the **/var/adm/spa/mm-dd-yyyy** file is used for the current day. If the data file is not in **/var/adm/spa**, you must provide a full pathname to the input data file.

Examples

Note that values of “NA” in a report indicate that data was not available for that period, for example, if **spadc** data collection was not active, or if the system had to be rebooted. A value of zero indicates data collection was activated but no activity occurred.

spar -ap

This command creates a report showing peak percent usage for the entire board and for each of the different algorithms allocated to the board. A partial sample output is shown below.

Signal Processing Activity Report(Peak Percent Usage By
Algorithm) 10/20/1997

CARD 5 STATE: Inserv CLASS: Signal_Processor(SP)
O.S.INDEX: 0

NAME: AYC2 OPTIONS: slave,tdml

FUNCTION: play+code

	brd	wwr	fwr	echo	cca	tts	dpr	play	code	celp	fax
00:20	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
00:40	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
01:00	0	0	0	0	0	0	0	0	0	0	0
.
.
.
08:20	16	5	0	8	1	2	0	0	0	0	0
08:40	22	13	0	5	3	2	0	0	0	0	0
09:00	32	15	0	9	5	3	0	0	0	0	0
09:20	47	26	0	10	5	6	0	0	0	0	0
09:40	55	33	0	12	4	6	0	0	0	0	0

10:00	57	28	0	9	11	10	0	0	0	0	0
10:20	68	37	0	11	13	8	0	0	0	0	0
10:40	69	42	0	10	9	8	0	0	0	0	0
11:00	71	44	0	11	10	9	0	0	0	0	0
11:20	66	42	0	4	10	11	0	0	0	0	0
11:40	91	58	0	15	8	10	0	0	0	0	0
12:00	80	47	0	12	16	5	0	0	0	0	0
12:20	77	39	0	10	15	13	0	0	0	0	0

Column headings reflect percent usage for the following:

- **brd** — All algorithms allocated to the board. Note that in a given row, the peak percentage for the board may be slightly different than the sum of the algorithm percentages because the peaks may not have occurred during the same interval. For example, if the **spadc** command collects data at 5-minute intervals, and the **spar** report displays the peak percentages for 20-minute intervals, the peak percentage for the board and for each of the algorithms may have occurred during any of the four different 5-minute **spadc** periods that provide data for the 20-minute **spar** interval.
- **wwr** — WholeWord recognition
- **fwr** — FlexWord recognition

- echo — Echo cancellation
- cca — Call Classification Analysis
- tts — Text-to-Speech
- dpr — Dial Pulse Recognition
- play — Play speech
- code — Record speech
- celp — Record speech with CELP algorithm
- fax — FAX

spar -l

This command creates a report showing average percent usage of licenses for each algorithm. A partial sample output is shown below.

```
RTU Report (Average Percent License Utilization Across System)
10/23/1997
```

	tts	dpr	flex	whole	swtts	fax

spadc

spsav

The **spsav** command backs up speech (SSP [only](#)).

Synopsis

spsav -O <file> [-v] -t [talkfile <list>] [phrase <list>] [listfile <list>]

Description

The **spsav** command backs up the specified talkfile number, phrase number, listfile, or phrase and talkfile of the speech. Only speech in the speech file system can be backed up using the **spsav** command.

The parameters for the **spsav** command are as follows:

- **-O file** — This parameter specifies the output device. Typically, this is cartridge tape (*/dev/rmt/c0s0*).
- **-v** — This parameter is the verbose flag that gives a running commentary of speech being saved.
- **-t** — This parameter is the tape flag. This is required for back up to cartridge tape.
- **[talkfile <list>]** — This parameter specifies the list of talkfiles to be backed up, specified as a single digit, a range m-n, or the word **all**. If no value is given, the default is **all**.
- **[phrase <list>]** — This parameter specifies the list of phrases to be backed up, specified as a single digit, a range m-n, or the word **all**. If no value is given, the default is **all**.
- **[listfile <list>]** — This parameter specifies the list of listfiles and associated speech to be backed up, for example, **listfile list.cabnt**.

The **spsav** command invokes an interactive program asking you to insert and remove cartridge tapes periodically. If the **-v** option is used, the system displays information about each step of the back up.

Example

The following example saves listfile "list.cabnt" from cartridge tape:

```
spsav -O /dev/rmt/c0s0 -v -t listfile list.cabnt
```

spStatus

The **spStatus** command displays information about the pack file running on an SP card.

Synopsis

```
spStatus [-b SP-index] [-i interval] [-c count] [-r] [-B]
```

Description

A substantial amount of information about the state of an SP Executive pack (PRI and CCA pack files) is available from shared memory and the program **spStatus**, which displays the information. The information is defined in **include/spStatus.h**.

The following are the options that can be used with the **spStatus** command:

- b SP-index** Index of the SP card to be examined.
- i interval** Interval between examinations of SP status
Minimum interval is 2 seconds. The default is 60 seconds
- c count** Number of times SP status is to be examined. The default is 1.
- r** Reset the executive and task counts before starting.
- B** No bell when running in iterative mode.

The **spStatus** *command* can be run in once, which is the default, or an iterative mode. In the iterative mode, it prints the changes between each successive examination of the values stored in the **spcon** structure in shared memory.

Sample Format

The following is an example of the sample output if **spStatus** is against the CCA pack.

The following is a brief description of each element of the display:

Romstate, Romcmd, Romargs

These three values are active if either the ROM is in control of the SP card or a debugger is in charge.

Ramstate, Pack Features, Pack Type

If a packfile is running or being debugged Ramstate contains the ID of the pack. If the pack is an SP Executive type pack, the Pack Features indicate which tasks are available in this pack. The Pack Type is either “SP executive” or “Original.”

Bootcnt, SPtime, SPusage

Bootcnt is incremented each time the ROM restarts. Only diagnostics currently alter it in any other way. SPtime is the time in 16 millisecond increments since the pack started. If **spStatus** is running in recursive mode, this value is not changing, and the debugger is not active, the following warning is generated:

```
"No Clock! Check TDM master"
```

This means that either there is no TDM master and hence no TDM interrupts, or the pack file is stuck at priority level 6 or 7 and so all interrupts are blocked. In the former situation, check your T1 cards and make sure that one of them is the TDM master. In the latter case, you have a bug. Use **msdb** and examine the pack file. **SPusage** is the current load factor on the SSP card. This is the last value of meaning if the pack is an original-style pack. The remaining information applies only to SSP Executive packs.

Debug ID, spFreeMemory

Debug ID is set to the pid of the UNIX process currently debugging this SP card. It is used to avoid collisions between people attempting to debug code running on a card. *spFreeMemory* is the amount of memory free in the memory allocation arenas, which are managed by *malloc()*, *realloc()*, and *free()*.

Free Actions

The number of *Action* structures not currently assigned to a time slot. This value is initially 50.

Busy Actions

The number of *Action* structures currently assigned to time slots.

Active Letters

The number of letters being carried in *Chainmail* structures for long time processing via *Action* structures.

Free DSPs, Broken DSPs, Busy DSPs

The number of DSP processors available to do work, broken, and assigned to work.

Run Queue Length, Sleep Queue Length

The number of processes waiting to run and the number waiting for some event to wake them up.

Running Process ID, Running Action Index

The process ID of the SP Executive process currently running and the index of the *Action* structure currently active.

DSP Requests

The number of *DspRequest* structures active.

RPC Requests Done, RPC Requests Queued, RPC Requests Discard

The number of remote procedure call requests that have been performed, the number that are waiting to be done, and the number of requests that had to be discarded before the backlog was too large.

Exception #, Exception Adr

The 680X0 hardware exception number and the name of the exception that has stopped the 680X0 processor and either sent it to the ROM or to the debugger and the address where the exception took place. These can be invaluable in case of a fatal error.

Routine

Currently not used.

PC at last TDM Intr, PC at last DSP Intr

Addresses at which the TDM and DSP last interrupted.

Info Flags

Currently there are two pieces of information conveyed by these flags, whether the processor is currently within a DSP interrupt and whether it is within a TDM interrupt. Both, neither, or any combination could be true.

DSP Count

The number of DSP interrupts processed.

CTL Flags

The current value of the CTL flags. These are used to control optional code within a pack. See [spCtlFlags](#) for further information.

Timer Requests

The number of timer requests that have been made.

Active Timers, Completed Timers, Killed Timers

The number of timer requests currently outstanding, the total number of timer requests that have run to completion, the number of timer requests that were removed prior to execution. If these values do not total up properly, there is also a warning indicating that there is trouble.

Work Search Loops

This is the number of times divided by 1000 that the SP Executive has gone through its base level work search loop, trying to find something productive to do. The change in the number goes down as the SP Executive becomes busier and busier doing productive work.

TDM Overruns

This number should always be zero. If it is not, it indicates that some activity is taking too long and blocking the processing of a TDM interrupt before it rolls over and starts overwriting data. This is a serious problem.

TDM Servicings Deferred

This is the number of times that a TDM servicing was deferred because the TDM interrupt came in on top of a DSP interrupt for a time slot. It is not a serious problem. It just indicates that the hardware is busy and conflicts are being resolved. It can be a potential area of difficulty if the DSP routine is too slow and the TDM overruns while it is waiting to be serviced.

Letters Received, Letters Sent, Letters Deferred, Letters Discarded

This is the number of letters received from the PC, the number of letters sent to the PC, the number of letters going to the PC that had to be temporarily stored in the overflow area because the PC was not keeping up, and the number of letters that even the overflow area could not handle and had to be discarded. Going into the overflow area is an indication of potential trouble, but is not serious if the duration is short. If the SP code continues to generate too many letters in too short of a period of time, then it becomes a serious problem. The same thing can happen if the PC cannot keep up.

Executive Time, Idle Time, Task[]

These counts indicate the load being placed on each portion of the system. The executive time is the number of times the TDM interrupted some activity of the SP Executive that was what is considered to be the idle look-for-work activity. The idle time is the number of times the TDM interrupted the look-for-work activity. When tasks are active, a line appears for each task. The index of the task is its position in the **tasks[]** array found in the associated **sp/config/taskTbl*.c** file.

Mailbox Information — Index, Empty, Full

The mailbox information is rudimentary information about activity within each mailbox. It does not tell you how many letters have been sent via each mailbox. However, it does tell you whether the mailbox is empty (1st Empty == 1st Full) and if the values are changing from one display to the next, you know mail is passing through that mailbox. Keep in mind that mailbox 1, from the PC, is now reserved by the kernel and is used by the `ioctl()` form of mail sending for all processes other than the limited number of processes that directly own mailboxes.

In iterative mode, only those lines whose values have changed since the list display are listed. On decimal entries, the delta value since the last time is also printed.

spVrision

The **spVrision** command prints the version of the SSP driver currently installed on a machine.

Synopsis

spVrision

Description

The **spVrision** command prints which version of the SP driver is installed. This can be either the 12-MB version or the 44-MB version.

start_vs

The **start_vs** command brings the system up to a fully operational state.

Synopsis

start_vs

Description

The **start_vs** command returns the voice system software to fully operational state. If you use the **stop_vs** command to stop the system, you should use

the **start_vs** command to start it again. The **start_vs** also should be used if the system was rebooted or powered down after **stop_vs** was used.

The **start_vs** command checks to see if the user stopped the system with the **stop_vs** command. The **start_vs** command places all cards placed in the manual-out-of-service (MANOOS) state with the **stop_vs** command in the in-service (INSERV) state.

You must be logged on to the system console as *root* to use the **start_vs** command.

Since the **/vs/data/spchconfig** file cannot be edited while the voice system processes are running, it is a good idea to check the value of nbufs in the **/vs/data/spchconfig** file before executing the **start_vs** command. The value of nbufs defines the number of speech buffers. For the voice system to operate properly, nbufs must be set to 2.5 times the number of active channels.

Example

The following example starts the voice system software:

```
start_vs
```

See Also

stop_vs

stop_vs

The **stop_vs** command gracefully stops the voice system software.

Synopsis

stop_vs [*time_out*] [-*n*]

Description

The **stop_vs** command gracefully stops the voice system software. If the system is receiving calls, **stop_vs** waits for approximately 3 minutes before it unconditionally stops the software. By waiting, the system allows callers to finish their transactions. The **stop_vs** command disables incoming call recognition on all cards to prevent them from being reactivated by an incoming call.

The *time_out* option is the time to wait before the voice system is stopped. The default value for this option is 180 seconds. The *-n* option prompts you with a message that another maintenance command (**restore**, **remove**, **attach**, **detach**, **diagnose**) is being performed. It asks if you want to continue or to terminate the **stop_vs** command. The **stop_vs** command terminates another maintenance command in progress when initiated. The default value for this option is **Yes**.

If you use **stop_vs** to stop the system, you should use **start_vs** to reactivate it. If you use **stop_vs** to stop the software and then reboot the machine, be

sure to execute **start_vs** after logging in as *root*. This ensures that the system is returned to the state it was in before it was rebooted.

Example

The following example stops the voice system software:

```
stop_vs
```

See Also

```
start_vs
```

striphdr

The **striphdr** command strips voice or code headers from a speech file (SSP only).

Synopsis

```
striphdr [voice/code]
```

Description

Striphdr is a filter that removes either the voice or code headers from a speech file. Voice headers are required for files being edited by the GSE, and

code headers are required for speech that is to be used with the voice system.

See Also

addhdr

sysmon

The **sysmon** command executes a program that monitors incoming telephone lines and the associated cards to see that they are functional.

Synopsis

sysmon <*page number*>

Description

The **sysmon** command verifies that each incoming telephone line and its associated card are functional. Before initializing the test, locate a touchtone telephone close to the system controller and get a telephone number to be used for dialing into the system. Use the **assign channel** command to assign to a group any channels you want to test. Then, use the **assign service/startup** command to assign a script to the same group.

Once the channels and service are assigned, enter the *sysmon* command followed by the number of pages, or screens, you want to see. Each page displays 120 to 140 channels.

The resulting display shows all channels and their current states. Note that only equipped channels can be in the IDLE or MOOS state, while unequipped channels are followed by dashes (--).

Enter the telephone number for the touchtone telephone. Watch the display on the monitor and note the channels that receive the call. Follow the instructions provided by the voice system. Enter **0000** to end the test.

Example

The following example shows page four of the system monitor display.

```
sysmon 4
```

tas

The **tas** command executes the transaction assembler (tas) program to assemble script instructions.

Synopsis

```
tas [-e] [-I<include_directory> -T<talk_directory> -U<name> -D<name>  
-D<name_def> -Y<dir> -H] -o<output_file> <application_name>.t
```

Description

The **tas** command is used to assemble script instructions recorded in an ***application-name.t*** file. It produces an executable file designated ***application-name.T***, which is stored in a table as a list of executable script instructions.

The **-e** option requires exact string matches for speech phrases.

The arguments must be in the order given above for the command to work properly. The directory search specified by the arguments are **I** (include file) and **T** (listfile). No space is allowed between the **-I** and **-T** flags and their path names, but space is allowed after the **-e** flag. Note that the **-I** option to **tas** is interpreted by `cpp(1)`.

The remaining arguments are:

- **-U <name>** — Remove any initial definition of *name*, where *name* is a reserved symbol that is predefined by the particular preprocessor (this option is interpreted by `cpp(1)`).
- **-D <name>** and **-D <name-def>** — Define *name* with value *def* as if by a `#define`. If no **-def** is given, *name* is defined with value 1. The **-D** option has lower precedence than the **-U** option. That is, if the same name is used in both a **-U** option and a **-D** option, the name is undefined regardless of the order of the options (this option is interpreted by `cpp(1)`).
- **-Y <dir>** — Use directory *dir* in place of the standard list of directories when searching for `#include` files (this option is interpreted by `cpp(1)`).

- **-H** — Print, one per line on standard error, the path names of included files (this option is interpreted by `cpp(1)`).
- **-o <output_file>** — The name of the output file. The default is **out.T**.

Note that the maximum number of literals per script allowed by the **tas** command is 450. If there are more than 450 literals in a script, the system displays the error message “literal table overflow.” Additional limitations enforced by the **tas** command are (whichever occurs first in a list file):

- 1,000 phrases
- 4,000 words
- 40,000 characters

If more phrases are needed by an application, use multiple list files and `tfile` instructions within the script.

Note: If your script contains a large number of define statements, **tas** may report messages such as the following during compilation:

```
script.t: 1068: too much defining
```

where *script.t* is the script source file and *1068* is the line in which the define appears. The limit to the number of define statements that a script may have depends on the number of defined macros and their size. If this type of message appears, reduce the number of define statements in your script.

Files

/vs/bin/tas

Examples

tas example.t

The program includes applicable header files and replaces literal definitions with corresponding numbers to produce an assembled version of the script. The assembled code is stored on disk under the label **example.T**. The unassembled instructions are found in the file **/var/appIN/trans/example.t**.

tas example.t -I/var/include -T/var/speech

In addition to performing the same functions described for the previous example, **tas** checks the files in **/var/include** when processing include statements and the file in **/var/speech** when processing T-file statements.

trace

The **trace** command outputs trace messages to standard output, while the system is taking calls, for specified processes and channels.

Note: This information may be useful for debugging applications and dips.

Synopsis

```
trace [name]...[chan <range>]...[card <card #[.port#>]]...[area  
[,area...]...]  
[level [,level...]...][date] [tracelog | startlog]...[sleep <sleeptime>]
```

Description

The **trace** command prints trace messages to the standard output device (stdout) according to specified options. Executing trace also causes trace output to be logged to the trace shared memory buffer or to the trace log.

When trace is specified with *name*, all process-specific trace messages from process *name*, are printed. Process-specific trace messages are printed regardless of which channels that process may own or on which channels they are operating.

When trace is specified with *chan* or *card* options, all channel-specific messages, from any process are printed. The *card* option is applicable only to network interface cards (that is, cards that have channels). The *card* option is a special case of the channel option.

A combination of the *name* variable and *chan* options prints trace messages from both the *name* and *chan* options. The *name* and *chan* options act collectively rather than selectively.

If *area* is specified, only the process or channel messages associated with *area* are printed. The *area* option is, therefore, selective. Areas may be

integers ranging from 1 to 32. Areas 1 through 16 are available for user applications. The voice system reserves areas 17 through 32.

[Table 38](#) describes the trace area arguments.

Table 38. Trace Area Arguments

Argument	Description
AS (area 17)	Trace advanced service operations such as TTS and speech recognition.
EM (area 18)	Trace event management operations.
IN (area 19)	Trace caller input operations including touchtone and speech recognition.
PM (area 20)	Trace parameter management operations.
RM (area 21)	Trace resource management operations.
SE (area 22)	Trace script execution. This includes trace entries made implicitly by Script Builder applications and through <i>tas(1)</i> scripts via the <i>trace(3TSM)</i> command.
ST (area 23)	Trace call and application initialization and completion operations.
TS (area 24)	Trace telephony service operations.
VS (area 25)	Trace voice code and play operations.
ER (area 26)	Trace error processing operations.

1 of 2

Table 38. Trace Area Arguments

IL (area 27)	Trace internal library operations.
SI (area 28)	Trace script instructions. Every TSM script instruction displays a trace message.
AD (area 29)	Trace administration operations.
BM (area 30)	Trace bus management operations.
OT (area 32)	Trace old trace instructions. All old trace messages are placed in this area.
ALL (area 1–32)	Trace all areas.
<i>2 of 2</i>	

The default, if **area** is omitted, is all areas except SI (area 28). Trace areas may also be specified numerically with lists and ranges. For example, the following is legal:

```
trace chan 5 area 1-7,10,TS
```

A *level* argument may also be specified. Levels range from 1 through 32, where level 1 indicates the least amount of detail and level 32 indicates the greatest level of detail. Levels may be specified as a single number, comma-separated list, or ranges. The current internal voice system levels in use (levels 17 through 32) may be identified through mnemonics. A complete list of area and level mnemonics can be displayed by executing the **trace**

command with no arguments. The current voice system levels (areas 1 through 32) are defined as shown in [Table 39](#).

Table 39. Trace Level Arguments

Argument	Description
U (levels 1–16)	Trace all user levels.
AE (level 17)	Trace internal application error messages.
AG (level 18)	Trace internal application general messages.
AX (level 19)	Trace internal application enter/exit messages.
A (levels 17–19)	Trace all internal application levels.
FE (level 20)	Trace user-callable function error messages.
FG (level 21)	Trace user-callable function general messages.
FX (level 22)	Trace user-callable function enter/exit messages.
F (levels 20–22)	Trace all user-callable function levels.
PE (level 23)	Trace process interface function error messages.
PG (level 24)	Trace process interface function general messages.
PX (level 25)	Trace process interface function enter/exit messages.

1 of 2

Table 39. Trace Level Arguments

P (levels 23–25)	Trace all process interface function levels.
IE (level 26)	Trace error processing operations.
IG (level 27)	Trace internal library operations.
IX (level 28)	Trace script instructions. Every TSM script instruction displays a trace message.
I (levels 26–28)	Trace script instructions. Every TSM script instruction displays.
RH (level 29)	Trace RM Helper function enter/exit messages.
RE (level 30)	Trace RM Helper function error messages.
RG (level 31)	Trace RM Helper function general messages.
RX (level 32)	Trace RM function enter/exit messages.
R (levels 29–32)	Trace all RM Helper and RM function messages.
S (level 17–32)	Trace all irAPI system levels.
ALL (levels 1–32)	Trace all levels.

2 of 2

The default, if level is omitted, is levels *U*, *A*, *AE*, *FE*, *PE*, *IE*, and *RE*. Trace levels can also be specified numerically with lists and ranges.

If the *tracelog* option is specified, all trace messages are logged to the trace log file and sent to *stdout*. If *startlog* is specified, tracing is done to the trace log but no trace output is sent to *stdout*. The trace log file can be queried for data deposited from prior executions of the **trace** command by using the **display** command with the *tracelog* option.

Trace messages can be printed with or without the date and time when they are generated. If *date* is specified, the date and time are printed with each trace message. The date and time are always printed for messages in the trace log file.

If the *sleep* argument is specified, trace will sleep *sleeptime* milliseconds between reading the trace buffer. The default is 200 milliseconds.

The **trace stop** command clears any active trace settings, ensuring that no trace output is generated to the trace log.

By default, all trace messages are saved in a trace shared memory buffer. The trace buffer is a circular buffer. If trace messages are written to the trace buffer faster than the trace command can read them, eventually the trace buffer overflows and trace messages are lost. When this happens, trace prints the following message, where *XXX* is the number of trace messages lost:

```
TRACE: ***** LOST XXX RECORDS
```

Two ways to minimize the number of trace messages lost:

- Use the **sleep** argument of the trace command to decrease the time that trace sleeps between reading the buffer. The default sleep time is 200 milliseconds.
- Increase the size of the trace buffer by adding or modifying the line **TRACE_BUFFER_SIZE=X** in the **/vs/data/irAPI.rc** file, where **X** is the number of messages that the trace buffer can hold. The default is 256. Increasing the value of **X** should reduce the chance of losing trace messages.

CAUTION:

If you change the size of the trace buffer, you must stop and restart the voice system (**stop_vs** and **start_vs**). Otherwise, you will not be able to run trace.

Examples

The following are examples of valid level lists and ranges:

1,2 Trace levels at 1 and 2

1-4,FE Trace at levels 1, 2, 3, 4, and 20

all Trace at levels 1-32.

Note: Levels are not hierarchically inclusive. That is, level 3 does not imply that tracing at levels 1 and 2 also occurs, which could be achieved by using a range starting from 1. For example, **1-3** for levels 1, 2, and 3.

Note that a user input (touchtone and speech recognition) log can be implemented by the following trace command:

```
trace chan all area IN level F
```

Files

```
/usr/spool/log/data/trace*  
/vs/data/irAPI.rc
```

trarpt

The **trarpt** command generates a call traffic report.

Synopsis

```
trarpt <hours> <summarize> <date>
```

Description

The **trarpt** command generates a call traffic report. Information in this traffic report includes the number of calls coming in to the system during a specified time period, average holding time, and the percentage of time the channel was occupied for a certain hour. This report is sent to standard out (stdout). Before this can be done, the database system must be up and running, but the voice system does not need to be up.

The parameters for the **trarpt** command are:

- **<hours>** — Specifies the hours in which the traffic data was collected. The valid options can be a range between 0 to 23 (with 0 representing midnight and 23 representing 11 p.m.) or “all.”
- **<summarize>** — Indicates a traffic report or a traffic summary report to be generated. If the option is “n”, the report provides information on the total traffic volume for each channel in one-hour increments. If the option is “y,” the report is a summary report that provides information on the total traffic volume for each channel for the whole period specified in the **<hours>** parameter.
- **<date>** — Specifies the date the data was collected in the system. This parameter can be in the mm/dd/yy or mm/dd/yyyy format.

If a 2-digit year argument is used, the following rules apply:

- ~ If the year argument is 70 and above, the 20th century is assumed. For example, 5/27/96 is interpreted as May 27, 1996.
- ~ If the year argument is between 00 and 69, the 21st century is assumed. For example, 5/27/06 is interpreted as May 27, 2006.

Example

The following two examples generate a traffic summary report for data collected on date August 24, 1993 between 8 a.m. and 5 p.m. on multiple entries per channel, and are equivalent command statements.

```
trarpt 8-17 y 08/24/93
```

```
trarpt 8-17 y 08/24/1993
```

The following two examples generate a traffic report for data collected on date August 24, 1993, one entry per channel, and are equivalent command statements.

```
trarpt all n 08/24/93
```

```
trarpt all n 08/24/1993
```

unassign_permissions

The **unassign_permissions** command removes voice system security permissions for a specific user.

Synopsis

```
unassign_permissions <user login>
```

Description

The **unassign_permissions** command removes voice system security permissions for a specific user.

The <user login> argument represents the user for which voice system permissions are to be removed. The user login will still exist; however, the user will not be able to access the voice system.

Example

The following example executes the command to remove voice system security permissions.

```
unassign_permissions brown
```

See Also

```
display_permissions  
assign_permissions
```

vfyLogMsg

The **vfyLogMsg** command verifies the information associated with a specific logging message format.

Synopsis

```
IComp <msgnum>
```

Description

The **vfyLogMsg** command, given a message number or symbolic message name, recomposes the message format from the information stored in the **cmpLogFmt** files generated by **IComp**.

Note: You cannot use the **vfyLogMsg** command to look up a message format for a message class that you have just created, but not yet installed.

The *msgnum* argument can be in any of the following four formats:

- absolute message number

The absolute message number format would be used if you were examining compressed logging files with an editor, for example, **238**

- symbolic name

The symbolic name is found in the associated **log{CLASS}.h** header file, for example, **SYSMSG**

- message class/relative index in class pair
- **logGEN(2)** or **GEN.2**

This last format can be specified in two ways: **logGEN(2)** or **GEN.2**
Two forms exist because the log{CLASS}(index) form must be enclosed in quotes when used from the command line because the '(' and ')' are shell meta-characters, which are difficult to type.

The output of the **vfyLogMsg** command contains up to five different types of information about the message format:

- Interpretations of the message number

The first block of information contains the three interpretations of the message number.

- Restored message format

The second block of information includes the restored message format without any of the SQL field names that might have been specified in the original format.

- SQL field name information

This information is the SQL field name information either as specified in the original format or as generated by IComp for those fields that did not have specifications in the input description. One description line exists for each argument on the machine.

- Current message priority

The fourth block of information describes the current priority assigned to this message in that shared memory and the destination bit mask. This block of information is available only if the logging destination/priority shared memory exists on the machine.

- Description of each destination bit

The fifth block of information describes each destination bit specified in the destination bit mask, starting with the lowest order bit.

vsdisable

The **vsdisable** command disables the automatic restarting of the voice system.

Synopsis

vsdisable

Description

The **vsdisable** command is used to prevent the voice system from being started when the system is rebooted. Running **vsdisable** allows you to log into the system before the voice system is started. The voice system may be started manually at any time with the **start_vs** command.

Example

vstdisable

See Also

vsenable

vsenable

The **vsenable** command enables the automatic starting of the voice system at system reboot.

Synopsis

vsenable

Description

When the **vsenable** command is run, UNIX system files are modified to allow the voice system to be automatically started when the system is rebooted. By default, the voice system is installed with the automatic startup enabled. If there were any nonfatal problems during installation, the voice system is still installed but it has not been enabled for automatic startup at system reboot. After the installation problems have been cleared, use **vsenable** to enable automatic voice system startup at reboot.

Example**vsenable****See Also****vstdisable**

vusage

The **vusage** command displays the current load on the voice system (SSP only).

Synopsis**vusage****Description**

The **vusage** command enables the voice system administrator to determine the load on the voice system. It queries the voice system and prints the response on the screen, indicating the maximum number of channels in the system and the number of channels playing or coding, and the maximum number of buffers and the number in use.

Example

The following is an example of the **vusage** command and sample output.

\$ vusage

Max (Current) Speech Buffers used: 0 (0)

Max (Current) Chans playing/coding: 0 (0)

\$

**WARNING:**

The voice system must be running to execute this command.

display chan
sysmon

wl_copy

The **wl_copy** command copies FlexWord wordlists to disk.

Synopsis

wl_copy <wordlist file>

Description

The **wl_copy** command copies the wordlist files or directories given by names out to a floppy disk. Names should be relative path names, not

absolute path names, since they will be used to load the vocabularies onto a FlexWord system.

Note: Make sure change to the directory where your FlexWord wordlists are located, usually **/att/asr/wordlists/active**.

If any of the names are directory names, the contents of the directories and any subdirectories are also copied to floppy disk.

Example

wl_copy database

wl_edit

The **wl_edit** command edits FlexWord wordlists.

Synopsis

```
wl_edit [-l <chan#>] [-s <ssp#>] [-L language] [-D <directory>] [-O] [-I] [-?]
```

Description

The **wl_edit** command invokes a Motif-based phoneme editor for wordlists. Wordlists are opened using a standard Motif interface, and then words can be added, changed, or deleted.

Audible playback is provided with Text-to-Speech so that you can hear the pronunciation of any word. You must dial into the channel specified with the `-l` option to hear the pronunciations.

Error messages are written to a small window at the bottom of the screen. Error messages are also logged to the file `/usr/tmp/wledit.output`.

The `-s <sspt#>` argument is used to specify which SSP circuit card to use for speech playback. Circuit cards are referenced by O.S. index displayed in the `display card` command.

The `-L language` argument is used to specify the language output that appears on the screen.

The `-D directory` argument is used to specify that the program will start in the given directory.

The `-O` option is for debugging purposes. It causes certain events to be recorded in the output window.

The `-I` option inhibits forced initialization of the SSP circuit cards. The `wl_edit` command usually determines if the cards need to be reset and provides a forced initialization. The advantage of using this option is that the FlexWord Editor comes up faster. The disadvantage is that in some unusual situations you may not be able to hear the pronunciation of your words. If this happens, run `wl_edit` again without specifying the `-I` option.

**WARNING:**

If the voice system is running, **wl_edit** will prompt you to stop the voice system before continuing.

See Also

wl_init

wl_gen

The **wl_gen** command creates data files for a FlexWord vocabulary.

Synopsis

wl_gen -L *language*

Description

The **wl_gen** command uses the wordlists in **/att/asr/wordlists/active** and the models in **/att/asr/models/seg.yy21** to create all of the data files needed for FlexWord recognition. In particular, **wl_gen** creates the following files:

- **/att/asr/grammar_hs/sw_grammar.h** — A header file for FlexWord recognition scripts
- **/att/asr/sr_files/sr_file.sw** — Reformatted active wordlists

- **/vs/pack/cmp.seg.sw** — Vocabulary and model information for companion card DSPs
- **vs/pack/resource.sw** — Wordlist resource information for the resource manager

The **wl_gen** command should be called whenever there is a change to an active wordlist or when a wordlist is activated or deactivated. You need to diagnose the FlexWord SSP circuit card after using the **wl_gen** command.

The [-L *language*] argument is used to specify the language output that appears on the screen, that is, Brazilian, English, French, German, Japanese, or Spanish.

If more than 38 phonemes, including the underscore (_), are found with any word or phrase within a wordlist by the **wl_gen** command, you receive an error message. Once **wl_gen** finds an error within a wordlist, it quits looking at that wordlist, and the wordlist containing that word or phrase is not used when generating the FlexWord data files. Therefore, if you receive an error, you might have to run **wl_gen** several times to iteratively locate each error.

An example of the error message you will receive regarding the filename **ACCT_NUM** is as follows:

```
Generating the FlexWord data files ...
```

```
'ACCT_NUM' ignored: it contains a word with more than 38  
phonemes
```

```
(Six_Six_Six_Six_Six_Six_Six_Six_Six_)
```

The **wl_gen** command retains the wordlist numbers of any active wordlist. This means that scripts do not have to be recompiled unless they use a wordlist that was not active on the previous invocation of **wl_gen**.

Example

wl_gen

See Also

wl_edit

diagnose card

wl_init

The **wl_init** command generates an initial wordlist from a set of words.

Synopsis

wl_init <file>

Description

The **wl_init** command takes a file consisting of words and/or phrases and adds a phonetic pronunciation for each word or phrase. The pronunciation is determined by a dictionary lookup, and uses the phonetic alphabet "cecilbet." The input file should consist of one word or phrase per line, with an underscore (_) instead of white space between words of a phrase. For

example, “call Rachel” should be written “call_Rachel.” Words are case insensitive. Each line of the file will be augmented with a tab followed by the cecilbet phonetic transcription of the line.

Example

wl_init database

See Also

wl_edit

wl_install

The **wl_install** command reads FlexWord vocabularies from floppy disk.

Synopsis

wl_install

Description

The **wl_install** command reads FlexWord vocabularies from a floppy disk, and copies them into **att/asr/wordlists/inactive**. It then asks whether any wordlists are to be activated, and if necessary, whether **wl_gen** should be run.

Example

wl_install

See Also

wl_copy

wl_gen

Numerics

23B+D

23 bearer (communication) and 1 data (signaling) channel on a T1 PRI circuit card.

30B+D

30 bearer (communication) and 1 data (signaling) channel (plus framing channel 0) on an E1 PRI circuit card.

47B+D

47 bearer (communication) and 1 data (signaling) channel on two T1 PRI circuit cards.

4ESS[®]

A large Lucent central office switch used to route calls through the telephone network.

5ESS®

A Lucent electronic switching machine used to route calls through the telephone network or private branch exchange.

A**AC**

alternating current

ACD

[automatic call distributor](#)

AD

application dispatch

AD-API

application dispatch application programming interface

adaptive differential pulse code modulation

A means of encoding analog voice signals into digital signals by adaptively predicting future encoded voice signals. This adaptive modulation method reduces the number of bits required to encode voice. See also [pulse code modulation](#).

adjunct products

Products (for example, the Adjunct/Switch Application Interface) that the system administers via cut-through access to the inherent management capabilities of the product itself; this is in opposition to the ability of the system to administer the switch directly.

ADPCM

[adaptive differential pulse code modulation](#)

ADU

[asynchronous data unit](#)

advanced speech recognition

A speech recognition ability that allows the system to understand WholeWord and FlexWord™ inputs from callers.

affiliate

A business organization that Lucent controls or with which Lucent is in partnership.

AGL

application generation language

ALERT

System alerter process

alerter

A system process that responds to patterns of events logged by the “logdaemon” process.

American Standard Code for Information Interchange

A standard code for data representation that represents alphanumeric characters as binary numbers. The code includes 128 upper- and lowercase letters, numerals, and special characters. Each alphanumeric and special character has an ASCII code (binary) equivalent that is 1 byte long.

analog

An analog signal, such as voice or music, that varies in a continuous manner. An analog signal may be contrasted with a digital signal, which represents only discrete states.

ANI

[automatic number identification](#)

announcement

A message the system plays to the caller to provide information. The caller is not asked to give a response. Compare to [prompt](#).

API

Application programming interface

application

The automated transaction (interactions) among the caller, the voice response system, and any databases or host computers required for your business.

application administration

The component of the system that provides access to the applications currently available on your system and helps you to manage and administer them.

application verification

A process in which the system verifies that all the components needed by an application are complete.

ASCII

[American Standard Code for Information Interchange](#)

ASI

analog switch integration

ASR

[advanced speech recognition](#)

asynchronous communication

A method of data transmission in which bits or characters are sent at irregular intervals and spaced by start and stop bits rather than by time. Compare to [synchronous communication](#).

asynchronous data unit

An electronic communications device that allows computer systems to communicate over asynchronous lines more than 50 feet (15 m) in length.

automatic call distributor

That part of a telephone system that recognizes and answers incoming calls and completes these calls based on a set of instructions contained in a database. The ACD can send the call to an operator or group of operators as soon as the operator has completed a previous call or after the system has played a message to the caller.

automatic number identification

A method of identifying the calling party by automatically receiving a string of digits that identifies the calling station of a particular customer.

B**back up**

The preservation of the information in a file in a different location, so that the data is not lost in the event of hardware or system failure.

backing up an application

Using a utility that makes an archive copy of a completed application or an interim copy of an application in progress. The back-up copy can be restored to the system if the on-line version is damaged, or if you make revisions and want to go back to the previous version.

barge-in

A capability provided by WholeWord and FlexWord speech recognition and Dial Pulse Recognition (DPR) that allows callers to speak or enter their responses during the prompt and have those responses recognized (similar to the Speak with Interrupt capability). See also [echo cancellation](#).

batch file

A file containing one or more lines, each of which is a command executable by the UNIX shell.

BB

bulletin board

blind transfer protocol

A protocol in which a call is completed as soon as the extension is dialed, without having to wait to see if the telephone is busy or if the caller answered.

bps

bits per second

BRDG

call bridging process

bridging

The process of connecting one telephone network connection to another over the system TDM bus. Bridging decreases the processing load on the system since an active bridge does not require speech processing, database access, host activity, etc., for the transaction.

bundle

In the context of the Enhanced File Transfer package, this term is used to denote a single file, a group of files (package), or a combination of both.

byte

A unit of storage in the computer. On many systems, a byte is 8 bits (binary digits), which is the equivalent of one character of text.

C**call classification analysis**

A process that enables application designers to use information available within the system to classify the disposition of originated and transferred calls. CCA is an optional feature package.

call data event

A parameter that specifies a list of variables that are appended to a call data record at the end of each call.

call data handler process

A software process that accumulates generic call statistics and application events.

called party number

The number dialed by the person making a telephone call. Telephone switching equipment can use this number to selectively route an incoming call to a particular department or agent.

caller

The party who calls for a service, gets connected to the system, and interacts with it. As the system can also make outbound calls for service, the caller can also be the person who responds to those outbound calls.

call flow

See [transaction](#).

call progress tones

Standard telephony sounds that indicate the status of the call. These sounds include busy, fast busy, ringback, reorder, etc.

card cage

An area within a hardware platform that contains and secures all of the standard and optional circuit cards used in the system.

cartridge tape drive

A high-capacity data storage/retrieval device that can be used to transfer large amounts of information onto high-density magnetic cartridge tape based on a predetermined format. This tape can be removed from the system and stored as a backup, or used on another system.

CAS

channel associated signalling

caution

An admonishment or advisory statement used in the system documentation to alert the user to the possibility of a service interruption or a loss of data.

CCA

[call classification analysis](#)

CDH

[call data handler process](#)

CELP

[code excited linear prediction](#)

central office

An office or location in which large telecommunication devices such as telephone switches and network access facilities are maintained. These locations follow strict installation and operation requirements.

central processing unit

See [processor](#).

CGEN

Voice system general message class

channel

See [port](#).

channel associated signaling

A type of signaling that can be used on E1 circuit cards. It occurs on channel 16.

circuit card upgrade

A new circuit card that replaces an existing card in the platform. Usually the replacement is an updated version of the original circuit card to replace technology made obsolete by industry trends or a new system release.

cluster controller

A bisynchronous interface that provides a means of handling remote communication processing.

CO

[central office](#)

code excited linear prediction

A means of encoding analog voice signals into digital signals that provides excellent quality with use of minimum disk space.

command

An instruction or request the user issues to the system software to make the system perform a particular function. An entire command consists of the command name and options.

configuration

The arrangement of the software and hardware of a computer system or network. The system configuration includes either a standard or custom processor, peripheral equipment (for example, printers and modems), and software applications. Configuration also refers to the way the switch network is set up; that is, the types of products that are in the network and how those products communicate.

configuration management

The component of the system that allows you to manage the current configuration of voice channels, host sessions, and database connections, assign scripts to run on specific voice channels or host sessions, assign functionality to SSP and E1/T1 circuit cards, and perform various maintenance functions.

connect and disconnect (C and D) tones

DTMF tones that inform the system when the attendant has been connected (C) and when the caller has been disconnected (D).

connected digits

A sequence of digits that the system can process as a group, rather than requiring the caller to enter the digits one at a time.

controller circuit card

A circuit card used on a computer system that controls its basic functionality and makes the system operational. These circuit cards are used to control magnetic peripherals, video monitors, and basic system communications.

copying an application

A utility in which information from a source application is directed into the destination application.

coresidency

The ability of two products or services to operate and interact with each other on a single hardware platform.

CPE

customer provided equipment or customer premise equipment

CPN

[called party number](#)

CPT

[call progress tones](#)

CPU

[central processing unit](#)

CPU Complex

The processor for the UCS 1000 R4.2 consisting of a single-board computing circuit card and an I/O companion board (SBC/IOB). The CPU complex is also used in other compactPCI platforms.

crash

An interactive utility for examining the operating system core and for determining if system parameters are being exceeded.

CSU

channel service unit

custom speech

Unique words or phrases to be used in system voice prompts that Lucent Technologies custom records on a per-customer basis.

custom vocabulary

A specialized package of unique words or phrases created on a per-customer basis and used by WholeWord or FlexWord speech recognition.

CVS

converse vector step

D**danger**

An admonishment or advisory statement used in system documentation to alert the user to the possibility of personal injury or death.

data interface process

A software process that communicates with Script Builder applications.

database

A structured set of files, records, or tables.

database field

A field used to extract values from a local database and form the structure upon which a database is built.

database record

The information in a database for a person, product, event, etc. The database record is made up of individual fields for each information item.

database table

A structure, made up of columns and rows, that holds information in a database. Database tables provide a means of storing information that changes too often to “hard-code,” or store permanently, in the transaction outline.

dB

decibel

DB

database

DBC

database checking process

DBMS

database management system

DC

direct current

DCE

data communications equipment

DCP

digital communications protocol

debug

The process of locating and correcting errors in computer programs; also referred to as [troubleshooting](#).

default

The way a computer performs a task in the absence of other instructions.

default owner

The owner of a channel when no process takes ownership of that channel. The default owner holds all idle, in-service channels. In terms of the IRAPI, this is typically the Application Dispatch process.

diagnose

The process of performing diagnostics on a bus or on Tip/Ring, E1/T1, or SSP circuit cards.

dial ahead

The ability to collect and process touch-tone inputs in sequence, even when they are received before the prompts.

dial pulse recognition

A method of recognizing caller pulse inputs from a rotary telephone.

dialed number identification service

A service that allows incoming calls to contain information about the telephone number for which it is destined.

dial through

A capability provided by touch-tone and dial pulse recognition that allows callers to enter their responses during the prompt and have those responses recognized (similar to the Speak with Interrupt capability). See also [barge-in](#) and [echo cancellation](#).

DIO

disk input and output process

DIP

[data interface process](#)

directory

A type of file used to group and organize other files or directories.

DMA

direct memory address

DNIS

[dialed number identification service](#)

DPR

[dial pulse recognition](#)

DSP

digital signal processor

DTE

data terminal equipment

DTMF

[dual tone multi-frequency](#)

DTR

data terminal ready

dual tone multi-frequency

A touch-tone sound that is an audio signal including two different frequencies. *DTMF feedback* is the process of the “switch” providing this information to the system. *DTMF muting* is the process of ignoring these tones (which might be simulated by human speech) when they are not needed for the application.

dump space

An area of the disk that is fixed in size and should equal the amount of RAM on the system. The operating system “dumps” an image of core memory when the system crashes. The dump can be fetched after rebooting to help in analyzing the cause of the crash.

E

E&M

[Ear and Mouth](#)

E1 / T1

Digital telephony interfaces, commonly called *trunks*. E1 is an international standard at 2.048 Mbps. T1 is a North American standard at 1.544 Mbps.

Ear and Mouth

A common T1 trunking protocol for connection between two “switches.”

EBCDIC

Extended Binary Coded Decimal Interexchange Code

echo cancellation

The process of making the channel quiet enough so that the system can hear and recognize WholeWord, FlexWord, and dial pulse inputs during the prompt. See also [barge-in](#).

editor system

A system that allows speech phrases to be displayed and edited by a user.

EIA

Electronic Industries Association

EISA

Extended Industry Standard Architecture

EMI

electromagnetic interference

Enhanced Basic Speech

Pre-recorded speech available from Lucent Technologies in several languages. Sometimes called [standard speech](#).

error message

A message on the screen indicating that something is wrong with a possible suggestion of how to correct it.

ESD

electrostatic discharge

ESS

electronic switching system

EST

Enhanced Software Technologies, Inc.

ET

error tracker

Ethernet

A name for a local area network that follows IEEE standard 802.3. Supported implementations are 10BaseT and/or 100BaseT.

event

The notification given to an application when some condition occurs that is generally not encountered in normal operation.

EXTA

external alarms feature message class

external actions

Specific predefined system tasks that Script Builder can call or *invoke* to interact with other products or services. When an external action is invoked, the systems displays a form that provides choices in each field for the application developer to select. Examples are Call_Bridge, Make_Call, SP_Allocate, SR_Prompt, etc. In Voice@Work, external actions are treated as [external functions](#).

external functions

Specific predefined (or customer-created) system tasks that Voice@Work or Script Builder can call or *invoke* to interact with other products or services. The function allows the application developer to enter the argument(s) for the function to act on. Examples are concat, getarg, length, substring, etc. See also [external actions](#).

F**FCC**

Federal Communications Commission

FDD

floppy disk drive

feature

A function or capability of a product or an application within the system.

feature package

An optional package that may contain both hardware and software resources to provide additional functionality to a standard system.

feature_tst script package

A standard system software program that allows a user to perform self-tests of critical hardware and software functionality.

FEP

front end processor

field

See [database field](#).

FIFO

first-in-first-out processing order

file

A collection of data treated as a basic unit of storage.

file transfer

An option that allows you to transfer files interactively or directly to and from UNIX using the file transfer system (FTS).

filename

Alphabetic characters used to identify a particular file.

FlexWord speech recognition

A type of speech recognition based on subword technology that recognizes phonemes or parts of words in a specific language. See also [subword technology](#).

foos

facility out-of-service state

FTS

file transfer process message class

function key

A key, labeled F1 through F8, on your keyboard to which the system software gives special properties for manipulating the user interface.

G**GEN**

PRISM logger and alerter general message class

grammar

The inputs that a recognizer can match (identify) from a caller.

GUI

graphical user interface

H

hard disk drive

A high-capacity data storage/retrieval device that is located inside a computer platform. A hard disk drive stores data on nonremovable high-density magnetic media based on a predetermined format for retrieval by the system at a later date.

hardware

The physical components of a computer system. The central processing unit, disks, tape, and floppy drives, etc., are all hardware.

hardware upgrade

Replacement of one or more fundamental platform hardware components (for example, the CPU or hard disk drive), while the existing platform and other existing optional circuit cards remain.

HDD

[hard disk drive](#)

hwoos

hardware out-of-service state

Hz

Hertz

IBM

International Business Machines

iCk or ICK

The system integrity checking process.

ID

identification

IDE

integrated disk electronics

idle channel

A channel that either has no owner or is owned by its default owner and is onhook.

IE

information element

IEEE

Institute of Electrical and Electronic Engineers

IND\$FILE

The standard SNA file transfer utility that runs as an application under CICS, TSO, and CMS. IND\$FILE is independent of link-level protocols such as BISYNC and SDLC.

independent software vendor

A company that has an agreement with Lucent Technologies to develop software to work with the system to provide additional features required by customers.

indexed table

A table that, unlike a nonindexed table, can be searched via a field name that has been indexed.

industry standard architecture

A PC bus standard that allows processors and other circuit cards to communicate with each other.

INIT

voice system initialization message class

initialize

To start up the system for the first time.

inserv

in-service state

Integrated Services Digital Network

A network that provides end-to-end digital connectivity to support a wide range of voice and data services.

intelligent CCA

Monitoring the line after dialing is complete to determine whether a busy, reorder (fast busy), or other failure has been encountered. It also recognizes when the extension is answered or if the extension is not answered after a specified number of rings. The monitoring capabilities are dependent on the network interface circuit card and protocol used.

interface

The access point of a system. With respect to the system, the interface is designed to provide you with easy access to the software capabilities.

interrupt

The termination of voice and/or telephony functions when some condition occurs.

Intuity Response Application Programming Interface

A library of commands that provide a standard development interface for voice-telephony applications.

IOB

I/O companion card to the [SBC](#). This is part of the [CPU Complex](#).

IPC

interprocess communication

IPC

intelligent ports card (IPC-900)

IRAPI

[Intuity Response Application Programming Interface](#)

IRQ

interrupt request

ISA

[industry standard architecture](#)

ISDN

[Integrated Services Digital Network](#)

ISV

[independent software vendor](#)

ITAC

International Technical Assistance Center

K**Kbps**

kilobytes per second

Kbyte

kilobyte

keyboard mapping

In emulation mode, this feature enables the keyboard to send 3270 keyboard codes to the host according to a configuration table set up during installation.

keyword spotting

A capability provided by WholeWord speech recognition that allows the system to recognize a single word in the middle of an entire phrase spoken by a caller in response to a prompt.

L**LAN**

[local area network](#)

LDB

[local database](#)

LED

light-emitting diode

library states

The state information about channel activities maintained by the IRAPI.

LIFO

last-in-first-out processing order

line side E1

A digital method of interfacing a system to a PBX or “switch” using E1-related hardware and software.

line side T1

A digital method of interfacing a system to a PBX or “switch” using T1-related hardware and software.

listfile

An ASCII catalog that lists the contents of one or more talkfiles. Each application script is typically associated with a separate listfile. The listfile maps speech phrase strings used by application scripts into speech phrase numbers.

local area network

A data communications network in a limited geographical area. The LAN provides communications between computers and peripherals.

local database

A database residing on the system.

LOG

System logger process message class

logical unit

A type of SNA Network Addressable Unit.

logdaemon

A UNIX system information and error logging process.

logger

See [logdaemon](#).

logging on/off

Entering or exiting the system software.

LSE1

[line side E1](#)

LSPS II

[Lucent speech processing solutions II circuit card \(6UB5\)](#)

LST1

[line side T1](#)

LU

[logical unit](#)

Lucent speech processing solutions II circuit card (6UB5)

A high-performance speech processing circuit card capable of simultaneous support for various speech technologies. In addition to the basic speech-processing features, The LSPS II circuit card provides enhanced Text-to-Speech capabilities and subword recognition for large vocabularies.

M**magnetic peripherals**

Data storage devices that use magnetic media to store information. Such devices include hard disk drives, floppy disk drives, and cartridge tape drives.

main screen

The system screen from which you are able to enter either the System Administration or Voice System Administration menu.

maintenance process

A software process that runs temporary diagnostics and maintains the state of circuit cards and channels.

manoo

manually out-of-service state

masked event

An event that an application can ignore (that is, the application can request not to be informed of the event).

master

A circuit card that provides clock information to the TDM bus.

Mbps

megabits per second

MByte

[megabyte](#)

megabyte

A unit of memory equal to 1,048,576 bytes (1024 x 1024). It is often rounded to one million.

menu

Options presented to a user on a computer screen or with voice prompts.

MF

[multifrequency](#)

MHz

megahertz

ms

millisecond

msec

millisecond

MS-DOS

A personal computer disk operating system developed by the Microsoft Corporation.

MTC

[maintenance process](#)

multifrequency

Dual tone digit signaling (similar to DTMF), used for trunk addressing between network switches or by network operators.

multichannel application

A single process/application that controls several channels. Each channel of the application is managed explicitly. Typically this means state information for each channel is maintained and the state of the application on each channel is tracked.

N**NCP**

Network Control Program

NEBS

Network Equipment Building Standards

NEMA

National Electrical Manufacturers Association

netoos

network out-of-service state

non-facility associated signalling

NFS

network file sharing

NM-API

Network Management - Application Programming Interface

NMVT

network management vector transport

nonex

nonexistent state

nonindexed table

A table that can be searched only in a sequential manner and not via a field name.

nonmasked event

An event that must be sent to the application. Generally, an event is nonmaskable if the application would likely encounter state transition errors by trying to it.

null value

An entry containing no value. A field containing a null value is normally displayed as blank and is different from a field containing a value of zero.

O**OEM**

original equipment manufacturer

on-line help

Messages or information that appear on the user's screen when a function key (usually F1) is pressed.

option

An argument used in a command line to modify program output by modifying the execution of a command. When you do not specify any options, the command executes according to its default options.

ORACLE

A company that produces relational database management software. It is also used as a generic term that identifies a database residing on a local or remote system that is created and maintained using an ORACLE RDBMS product.

P**PBX**

[private branch exchange](#)

PC

personal computer

PCB

printed circuit board

PCI

[peripheral component interconnect](#)

PCI Mezzanine Card

A PCI module, such as a LAN or RAID controller, that connects to the [CPU Complex IOB](#) companion card.

PCM

[pulse code modulation](#)

PEC

price element code

peripheral (device)

Equipment such as printers or terminals that is in addition to the basic processor.

peripheral component interconnect

A newer, higher speed PC bus that is gradually displacing ISA for many components.

permanent process

A process that starts and initializes itself before it is needed by a caller.

phoneme

A single basic sound of a particular spoken language. For example, the English language contains 40 phonemes that represent all basic sounds used with the language. The English word "one" can be represented with three phonemes, "w" - "uh" - "n." Phonemes vary between languages because of guttural and nasal inflections and syllable constructs.

phrase filtering (screening)

The rejection of unrecognized speech. The WholeWord and FlexWord speech recognition packages can be programmed to reprompt the caller if the system does not recognize a spoken response.

phrase tag

A string of up to 50 characters that identifies the contents of a speech phrase used by an application script.

platform migration

See [platform upgrade](#).

platform upgrade

The process of replacing the existing platform with a new platform.

pluggable

A term usually used with speech technologies, in particular standard speech, to indicate that a basic algorithmic technique has been implemented to accept one or more sets of parameters that tailors the algorithm to perform in one or more languages.

PMC

[PCI Mezzanine Card](#)

poll

A message sent from a central controller to an individual station on a multipoint network inviting that station to send if it has any traffic.

polling

A network arrangement whereby a central computer asks each remote location whether it wants to send information. This arrangement enables each user or remote data terminal to transmit and receive information on shared facilities.

port

A connection or link between two devices that allows information to travel to a desired location. See [telephone network connection](#).

PRI

[Primary Rate Interface](#)

Primary Rate Interface

An ISDN term for connections over E1 or T1 facilities that are usually treated as trunks.

private branch exchange

A private switching system, either manual or automatic, usually serving an organization, such as a business or government agency, and usually located on the customer's premises.

processor

In system documentation, the computer on which UnixWare and system software runs. In general, the part of the computer system that processes the data. Also known as the [central processing unit](#).

prompt

A message played to a caller that gives the caller a choice of selections in a menu and asks for a response. Compare to [announcement](#).

pseudo driver

A driver that does not control any hardware.

PSTN

public switch telephone network

pulse code modulation

A digital modulation method of encoding voice signals into digital signals. See also [adaptive differential pulse code modulation](#).

R**RAID**

redundant array of independent disks

RAID Array

An assembly of disk drives configured to provide some level of RAID functionality

RAM

random access memory

RDMBS

ORACLE relational database management system

RECOG

speech recognition feature message class

recognition type

The type of input the recognizer can understand. Available types include touch-tone, dial pulse, and Advanced Speech Recognition (ASR), which includes WholeWord and FlexWord speech recognition.

recognizer

The part of the system that compares caller input to a grammar in order to correctly match (identify) the caller input.

record

See [database record](#).

recovery

The process of using copies of the system software to reconstruct files that have been lost or damaged. See also [restore](#).

remote database

Information stored on a system other than your current system that can be accessed by your current system.

REN

ringer equivalence number

reports administration

The component of a system that provides access to system reports, including call classification, call data detail, call data summary, message log, and traffic reports.

restore

The process of recovering lost or damaged files by retrieving them from available back-up tapes or from another disk device. See also “recovery.”

restore application

A utility that replaces a damaged application or restores an older version of an application.

reuse

The concept of using a component from a source system in a target system after a software upgrade or platform migration.

RFS

remote file sharing

RM

resource manager

roll back

To cancel changes to a database since the point at which changes were last committed.

rollback segment

A portion of the database that records actions that should be undone under certain circumstances. Rollback segments are used to provide transaction rollback, read consistency, and recovery.

RTS

request to send

S**SCA**

single connector architecture

SBC

A single-board computing circuit card used the UCS 1000 R4.2. It is part of the CPU complex.

screen pop

A method of delivering a screen of information to a telephone operator at the same time a telephone call is delivered. This is accomplished by a complex chain of tasks that include identifying the calling party number, using that information to access a local or remote ORACLE database, and pulling a “form” full of information from the database using an ORACLE database utility package.

script

The set of instructions for the system to follow during a transaction.

Script Builder

An optional software package that provides a menu-oriented interface designed to assist in the development of custom voice response applications on the system (see also [Voice@Work](#)).

SCSI

[small computer system interface](#)

SDN

software defined network

shared database table

A database table that is used in more than one application.

shared speech

Speech that is a part of more than one application.

shared speech pools

A parameter that allows the user of a voice application to share speech components with other applications.

SID

station identification

single-threaded application

An application that runs on a single voice channel.

slave

A circuit card that depends on the TDM bus for clock information.

SLIP

serial line interface protocol

small computer system interface

A disk drive control technology in which a single SCSI adapter circuit card plugged into a PC slot is capable of controlling as many as seven different hard disks, optical disks, tape drives, etc.

SNA

systems network architecture

SNMP

simple network management protocol

software

The set or sets of programs that instruct the computer hardware to perform a task or series of tasks — for example, UnixWare software and the system software.

software upgrade

The installation of a new version of software in which the existing platform and circuit cards are retained.

source system

The system from which you are upgrading (that is, your system as it exists *before* you upgrade).

speech and signal processor circuit card (CWB1)

A high-performance signal processing circuit card capable of simultaneous support for various speech technologies.

speech energy

The amount of energy in an audio signal. Literally translated, it is the output level of the sound in every phonetic utterance.

speech envelope

The linear representation of voltage on a line. It reflects the sound wave amplitude at different intervals of time. This envelope can be plotted on a graph to represent the oscillation of an audio signal between the positive and negative extremes.

speech file

A file containing an encoded speech phrase.

speech filesystem

A collection of several talkfiles. The filesystem is organized into 16-Kbyte blocks for efficient management and retrieval of talkfiles.

speech modeling

The process of creating WholeWord speech recognition algorithms by collecting thousands of different speech samples of a single word and comparing them all to obtain a statistical average of the word. This average is then used by a WholeWord speech recognition program to recognize a single spoken word.

speech space

An area that contains all digitized speech used for playback in the applications loaded on the system.

speech phrase

A continuous speech segment encoded into a digital string.

speech recognition

The ability of the system to understand input from callers.

SPIP

signal processor interface process

SPPLIB

speech processing library

SQL

[structured query language](#)

SR

[speech recognition](#)

SSP

[speech and signal processor circuit card \(CWB1\)](#)

standard speech

The speech package available in several languages containing simple words and phrases produced by Lucent Technologies for use with the system. This package includes digits, numbers, days of the week, and months, each spoken with initial, medial, and falling inflection. The speech is in digitized files stored on the hard disk to be used in voice prompts and messages to the caller. This feature is also called Enhanced Basic Speech.

standard vocabulary

A standard package of simple word speech models provided by Lucent Technologies and used for WholeWord speech recognition. These phrases include the digits “zero” through “nine,” “yes,” “no,” and “oh,” or the equivalent words in a specific local language.

string

A contiguous sequence of characters treated as a unit. Strings are normally bounded by white spaces, tabs, or a character designated as a separator. A string value is a specified group of characters symbolized by a variable.

structured query language

A standard data programming language used with data storage and data query applications.

subword technology

A method of speech recognition used in FlexWord recognition that recognizes phonemes or parts of words. Compare to [WholeWord speech recognition](#).

switch

A software and hardware device that controls and directs voice and data traffic. A customer-based switch is known as a [private branch exchange](#).

switch hook

The device at the top of most telephones that is depressed when the handset is resting in the cradle (in other words, is *on hook*). The device is raised when the handset is picked up (in other words, when the telephone is *off hook*).

switch hook flash

A signaling technique in which the signal is originated by momentarily depressing the "switch hook."

switch interface administration

The component of the system that enables you to define the interaction between the system and switches by allowing you to establish and modify switch interface parameters and protocol options for both analog and digital interfaces.

switch network

Two or more interconnected telephone switching systems.

synchronous communication

A method of data transmission in which bits or characters are sent at regular time intervals, rather than being spaced by start and stop bits. Compare to [asynchronous communication](#).

SYS

UNIX system calls message class

sysgen

system generation

system administrator

The person assigned the responsibility of monitoring all system software processing, performing daily system operations and preventive maintenance, and troubleshooting errors as required.

system architecture

The manner in which the system software is structured.

system message

An event or alarm generated by either the system or end-user process.

system monitor

A component of the system that tests to verify that each incoming telephone line and its associated Tip/Ring or T1 circuit card is functional. Through the “System Monitor” component, you are able to see displays of the Voice Channel and Host Session Monitors.

T**T1**

A digital transmission link with a capacity of 1.544 Mbps.

table

See [database table](#).

talkfile

An ASCII file that contains the speech phrase tags and phrase tag numbers for all the phrases of a specific application. The speech phrases are organized and stored in groups. Each talkfile can contain up to 65,535 phrases, and the speech filesystem can contain multiple talkfiles.

talkoff

The process of a caller interrupting a prompt, so the prompt message stops playing.

TAM

[telecom alarm module](#)

target system

The system to which you are upgrading (that is, your system as you expect it to exist *after* you upgrade).

TAS

[transaction assembler script](#)

TCP/IP

transmission control protocol/internet protocol

TDM

time division multiplexing

telecom alarm module

An intelligent alarm module that provides critical, major, and minor alarm indicators.

telephone network connection

The point at which a telephone network connection terminates on a system. Supported telephone connections are Tip/Ring, T1, and E1.

Text-to-Speech

An optional feature that allows an application to play US English speech directly from ASCII text by converting that text to synthesized speech. The text can be used for prompts or for text retrieved from a database or host, and can be spoken in an application with prerecorded speech.

ThickNet

A 10-mm (10BASE5) coaxial cable used to provide interLAN communications.

ThinNet

A 5-mm (10BASE2) coaxial cable used to provide interLAN communications.

time-division multiplex

A method of serving a number of simultaneous channels over a common transmission path by assigning the transmission path sequentially to the channels, with each assignment being for a discrete time interval.

Tip/Ring

Analog telecommunications using four-wire media.

token ring

A ring type of local area network that allows any station in the network to communicate with any other station.

trace

A command that can be used to monitor the execution of a script.

traffic

The flow of information or messages through a communications network for voice, data, or audio services.

transaction

The interactions (exchanges) between the caller and the voice response system. A transaction can involve one or more telephone network connections and voice responses from the system. It can also involve one or more of the system optional features, such as speech recognition, 3270 host interface, FAX Actions, etc.

transaction assembler script

The computer program code that controls the application operating on the voice response system. The code can be produced from Voice@Work, Script Builder, or by writing directly in TAS code.

transaction state machine process

A multi-channel IRAPI application that runs applications controlled by TAS script code.

transient process

A process that is created dynamically only when needed.

troubleshooting

The process of locating and correcting errors in computer programs. This process is also referred to as debugging.

TSO

time share operation

TSM

[transaction state machine process](#)

TTS

[Text-to-Speech](#)

TWIP

T1 interface process

U**UCS**

Unified Communications Server

UK

United Kingdom

US

United States of America

UNIX Operating System

A multiuser, multitasking computer operating system originally developed by Lucent Technologies.

UNIX shell

The command language that provides a user interface to the UNIX operating system.

upgrade scenario

The particular combination of current hardware, software, application and target hardware, software, applications, etc.

usability

A measurement of how easy an application is for callers to use. The measurement is made by making observations and by asking questions. An application should have high usability to be successful.

USOC

universal service ordering code

UVL

unified voice library

V**VDC**

video display controller

vi editor

A screen editor used to create and change electronic files.

virtual channel

A channel that is not associated with an interface to the telephone network (Tip/Ring, T1, LSE1/LST1, or PRI). Virtual channels are intended to run “data-only” applications which do not interact with callers but may interact with DIPs. Voice or network functions (for example, coding or playing speech, call answer, origination, or transfer) will not work on a virtual channel. Virtual channel applications can be initiated only by a “virtual seizure” request to TSM from a DIP.

vocabulary

A collection of words that the system is able to recognize using either WholeWord or FlexWord speech recognition.

vocabulary activation

The set of active vocabularies that define the words and wordlists known to the FlexWord recognizer.

vocabulary loading

The process of copying the vocabulary from the system where it was developed and adding it to the target system.

Voice@Work

An optional software package that provides a graphical interface to assist in development of voice response applications on the system (see also [Script Builder](#)).

voice channel

A channel that is associated with an interface to the telephone network (T1, E1, or PRI). Any system application can run on a voice channel. Voice channel applications can be initiated by being assigned to particular voice channels or dialed numbers to handle incoming calls or by a “soft seizure” request to TSM from a DIP or the **soft_szr** command.

voice processing co-marketer

A company licensed to purchase voice processing equipment to market and sell based on their own marketing strategies.

voice response output process

A software process that transfers digitized speech between system hardware (for example, Tip/Ring and SSP circuit cards) and data storage devices (for example, hard disk, etc.)

voice response unit

A computer connected to a telephone network that can play messages to callers, recognize caller inputs, access and update a databases, and transfer and monitor calls.

voice system administration

The means by which you are able to administer both voice-related aspects of the system.

VPC

[voice processing co-marketer](#)

VROP

voice response output process

VRU

[voice response unit](#)

W**warning**

An admonishment or advisory statement used in system documentation to alert the user to the possibility of equipment damage.

watchdog timer

An timer that activates a [TAM](#) alarm when CPU activity is not received within the 30-second threshold.

WholeWord speech recognition

An optional feature package based on whole-word technology that can recognize the numbers one through zero, “yes”, and “no” (the key words). This feature is reliable, regardless of the individual speaker. This feature can identify the key words when spoken in phrases with other words. A string of key words, called *connected digits*, can be recognized. During the prompt announcement, the caller can speak or use touch tones (or dial pulses, if available). See also [whole-word technology](#).

whole-word technology

The ability to recognize an entire word, rather than just the phoneme or a part of a word. Compare to “subword technology.”

wink signal

An interruption of current to a busy lamp indicating that there is a line on hold.

word

A unique utterance understood by the recognizer.

wordlist

A set of words available for FlexWord recognition by an application during a Prompt & Collect action step.

word spotting

The ability to search through extraneous speech during a recognition.
